There is ONE good reason for selling to Europe first. In general, FCC type approval is harder to get than the corresponding approvals in Europe. So, Atari can begin selling the machines over here before they have been tightened down to FCC specs. Or, in other words, it may be that Europe is being used to 'bug-chase' the machines before they are released in the States, rather than being favored. Certainly, if problems DO occur with the early versions of a machine, it is better to have them surface in the market which is potentially smaller, rather than in the one which is potentially large.

>of course, exchanging disks if you are nervous.

The "KEY" virus is the most widespread virus in the USA. That is
because it displays no symptoms, it only spreads. It represents
two dangers:
1) It spreads to every disk that passes through the ST while the
virus is active, thus wiping out existing executable boot sectors
on disks which must have them. This can render a disk which must
be self-booting useless.

2) It is called the "KEY" virus because, once installed in a
system, it checks every passing disk for a "KEY" value in the
boot sector. If it locates one, it will cause the execution of
whatever code is on that disk, even if the machine is not being
powered up or reset at the time the "KEY" disk is located. There
have been no episodes of a "KEY" disk being located reported, to
date. That doesn't mean they don't exist. That only means that
I haven't heard of them, or the victim of whatever the "KEY" did
was not aware of the cause (which is quite likely, if such an event
has occurred).

Every virus killer I've seen (or written, of course) will eradicate
this virus.

Jeff,
I tried to mail to you directly the last time, but the message got sent back "userid not known". This seems to happen a lot on this network nowadays. Hopefully others will be interested too.

Having done some playing around with scrolling methods, I would say that blitting is definitely the way to go. Figure out the screen size in pixels, subtract the offset of the scroll amount (1, in your case), and use a raster copy opaque (vro_cpyfm(), if memory serves me right) to shift the screen by the offset amount. You will now need to overlay the "vacated" screen space. If you are working within a window, v_gtext() will work fine. It doesn't care what pixel it starts on, although it is faster if it is snapped horizontally to a byte boundary. If you are dealing with the alpha screen, you are in for some work, unless somebody in netland knows a quick way to do this. I would build the text line image in some buffer (alternate Logbase?) and blit a portion of it into the screen. I don't have much experience with the alpha mode, so I will defer to better advice here.

If you would like to see a code fragment for a window, send me a note. Perhaps personal mail works better.

Whats great is that the Atari is easily programmed by good hackers and so
so much is free. [The term hacker, is used here in its original complimentary
sense].

Turtle is available on USENET as freeware (I think is free, otherwise its
sharware and cheap). It is fast, reliable and even tries to wash the dishes.

> The monitor's power is on, and I can here keyclicks but no display.
>
> Does anyone have any advice?
>
Two obvious source of problem in the 520:
1. the connector is broken. The mono signal is on a different pin.
2. one of the monitors ASSERTS a signal to the 520. If it thinks its always
color, mono will surely be screwed up.
3. Internally the mono signals must make it thru parts of the motherboard
to get to the connector. (Maybe also thru a chip! [my drawings are
home]).

Bottom line. Your 520 is Broken.

The only time a phenomenon like the "Phantom" ever happened to me was in a
case similar to this, where I was typing in WordPerfect quickly or backspacing
quickly, and the machine sort of took over. This hasn't happened to me
in the last year or so; I attributed this to getting the Wordperfect 89 update
and/or moving to a mega ST (both of which happened around the same time :-).
If the people with mega's have experienced the phantom, could this problem be
solved in software (i.e., the new WordPerfect fixes the problem)?

>

I can, given the above response(s), readily understand your anger
towards me. For my somewhat out of line personal attacks, I do
apologise. However, I guess I should point out that the main point I
was (probably poorly) attempting to make was that one should not get on
other people's case when they ask for a program that does what they want
and hope that something in the public domain will fit the bill. I
realize that you wish to make a little money on your efforts, but
there's no need to lash out against them.

>
> Well, a man's got to eat.
>
> Hey, this line of discussion is counter productive. Flame off ok?
>

Yes, I agree that it is <was?> counter-productive. I also apologise (once again) for my rather vehement attack. I hope I have made my reasoning a little clearer. I shall endeavor to be more restrained in the future.

Gee. Sounds like one of the best reasons I've yet heard to buy WordPerfect, which has an auto-backup feature (I've never lost more than 8 minutes of work, and with my hard drive, I don't notice the autosaving at all).

Come to think of it, I've only seen the phantom typist twice the school year. It's shown up much less frequently in the last 8 months or so...the only thing I can think of that's different in my system is that I'm using TurboST

Actually, you can just include the postscript into troff input.
By adding a \! prefix, troff will just pass it thru to the typesetter.
I use this feature all the time to produce overheads for my
UNIX classes. I produce postscript with Publishing Partner and
then use a make file on the UNIX system to handle the preprocessing
of the postscript to add the prefixes (and strip out garbage generated by
PP. I use a macro in my troff source to include the postscript file and
tell troff how much space the figure will take. I am using devps to drive
the postscript printer or typesetter from troff.

Marshall ---

Funny you should mention this. :-)

I get three Europian ST mags, one in English and the
other two in German. The one in English is from the
UK and called ST World. It is really a decent rag, with
alot of (envious) product announcements, some decent articles/reviews,
and reasonable programming/hardware hacks. The 68000'er (German)
is similiar. ST Magazin (German) I let the subscription run out on
because it is a little to basic user oriented.

I think that Scott has sort of hit the nail on the head. But heck if I can get the creature to show up at my beckoning. I wonder if it takes a certain combination of keys that occur upon fatfingering. That would explain why it is so difficult to get the critter to show up. Furthermore, I still feel that it is on the keyboard side and not the motherboard side. Seems the fact that it has happened also with Spectre would be a significant clue.

1666. 64 pin socket for PC Speed

Newsgroup: comp.sys.atari.st
Date: 1990-02-13 21:10:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <90Feb13.170233est.57483@ugw.utcs.utoronto.ca>
Source record: 243589

As described earlier on the net, I installed PC Speed in my Mega. This involved soldering the supplied 64 pin DIP socket on top of my 68000. I want to be able to move PC Speed to another machine, which involves soldering another 64 pin socket on that machine's 68000. Problem is, I need another two 64 pin sockets (the second inserts in the soldered one to raise the PC SPeed board a reasonable distance off the Mega's motherboard), I called Active Electronics & they want 5.11 each but a minimum order of $25 is required. Does anyone know where I can buy two such sockets without having to blow $25 just to fulfill a minimum order requirement.

Note: I am looking for suppliers in Ontario, Canada if at all possible. It does not matter whether the supplier is commercial or private - I just want the sockets.

Thanks in advance!!!

1667. RE: Tape Backup

Date: 1990-02-13 21:19:24 UTC
From: blee@plains.UUCP
Message-ID: <3411@plains.UUCP>
Source record: 243525

I just got off the phone with Vance Chin of Berkley Micro Systems.
Unfortunately I was not able to confirm the information
given by Alex Leavens.
When I spoke to Vance (2:30 centeral, 2/13/90), he said that
the controler (BMS200) was $150 if I wanted a case with it; a shoe box
case (6x6x~12 (not the same as Alex's case)) with the bord was
$250.
Then I asked about software: He assumed I wanted it for a hard
drive, so he said that software for the tape backup would be extra
(I don't remeber if any price was given).

The only thing he said that was positive (in my view) was that
the BMS200 is the only controler that can handle 1:1 interleave
on the larger drives.

I hope this does not detract from Alex. I thank him for his personal
reply to questions about his equipment. There is a $100 discrepency
here and I would like to know where this is comming from. Possibly
just a salesman who wanted to get some extra commission or Alex received
a break for repeat business.

I don't work for anyone listed, I have no gripes with anyone,
I just hope I saved a phone call for someone...

>in its public distribution, have any means of supporting Adobe fonts or
>similar typefaces?

If you get MetaFont running, you can create all the fonts you want. Of course, you should have a good deal of spare time before you try this. The NeXT machines are shipped with a program called afmtotfm, which converts Adobe Font Metric files to TeX Font metric files. I don't remember if the source code is shipped as well, but that at least tells you that it's a doable thing.

TeX is by far the most versatile text processing system that exists; it can certainly handle things better than troff can. And, by switching to TeX/DVI output, you get the advantage of the device-independent output file format. Since you're using postscript already, that's probably not a big issue, but if you need to support any other types of printers DVI is a wonderful thing to be able to take advantage of. I've got a program (based on code from Imagen written 15 or so years ago) that I've been hacking on that takes troff CAT output and converts to DVI, just 'cause it's so handy at times...

Switchback can sort of do what you want. You can use it to partition your ST memory into chunks of 512K, 1meg, or 2meg (don't remember if there were other supported sizes) and run different programs in each partition, or take snapshots of the current partition and save them in other partitions. Then you run their buffer utility to save a partition to disk.

The switchback software could probably be altered to not use partitions, and just dump and restore all of memory as a single block, but it would need about 4K for control info. (That's how much it eats out of each of the partitions it sets up.)

(I just bought one of these a couple weeks ago; I like it a lot. Really slick. Of course, I use it with a Mega-4, with more RAM in an UltraDisk, so I can really put this thing thru its paces...) It's unfortunate that Alpha Systems no longer makes their UltraDisks - 4meg of memory there is quite the handy thing to have. I can run Minix in 4 meg and TOS in another 4 meg, and swap between the two at the touch of a button. Also, since the UltraDisk is battery backed up, if your machine locks up, as long as you had a copy of the current image stored there, you can just toggle the power and swap it back in and keep right on running. This is one of the most awesome hardware/software combos I've seen for the ST; I'm kind of surprised more people aren't using it.

I don't have their number handy right now, but you should be able to look 'em up in most ST magazines. I ordered Switchback straight from them and got it via UPS in 3 days. It works really well, I like it a lot...

From: J.-M. Zucconi (+33) 81666900 ZUCCONI at FRMOP11
To: info-atari16@wsmr-simtel20.army.mil
Subject: read/write to the DMA port

I try to use the DMA port to write and read data (not in DMA mode)
typically to send commands to an external controller. The problem I meet
is that I can't read safely from the DMA port. After several checkings
I have found that I always read the last byte written on the port. Further
investigations show that if I wait 'some' time before reading the port, the
value returns to zero. The following code shows that. It should be noted
that during execution, NOTHING is connected to the DMA port!
I write the value 0xff to the port. If the parameter 'time' is set
to 0x1fff, I read 0xff. when time is set to 0x5fff, I read 0x0 (correctly?)
and if time is set to 0x3fff, I get 0xe0 !!!

Could someone tell me what is wrong in my code and how to write/read via the
DMA port?

Thanks
J.-M.

>>as an UNSIGNED int, with a range of 0 to 65535, and consequently a
>>32Mb limit.

Wrong.

>Actually, the logical sector size was also increased [...]

Right. The logical sector size is now "large enough so the partition can be represented by 32767 sectors," which is to say 512 bytes for <16MB, 1024 bytes for <32MB, etc. all the way up to 8K/sector or more.

This means BIG TROUBLE for any program which does Rwabs() calls and expects to get 512 bytes per sector: you should use Getbpb() to FIND OUT how big sectors are, rather than assuming any one value. It's also BIG TROUBLE for programs which add buffers to GEMDOS via the "bufl" system variables: it's hard (not impossible) to tell how large each buffer must be. Get the AHDI 3.00 Release Notes from Atari (available to developers) for the grubby details.

>>the old Dfree()/FAT search bug rears up

There is no such bug; I think you mean "really horribly slow implementation."

>>and file creation takes nearly forever.

That part is true. So take your own advice and get TOS 1.4!

>---
> * Via ProDoor 3.1R

It sounds like you are setting your codes in the middle of your dicument.
There are a few basic rules you have to remember when using WordPerfect:

-Everything is done in codes. When you set your tabs, it inserts a code
sequence into your document. This code is treated as a single character.
Use Reveal Codes to display the text and codes in a document.

-The codes only affect the text which comes *after* the code and before
another occurance of the same code.

-Some codes have an explicit start and end. Bold, for instance, will start
with a big B ([B] in reveal codes) and end with a little b ([b] in reveal
codes). These codes are inseperable and if one is deleted, the other will
be removed. The only way to restore these types of codes is by using the
block feature to highlight the text and press the appropriate code.

As far as indenting goes, try following these guidelines: Use tabs up to the tab stop just previos to where you want to start indenting then use a tab to
indent the first line of the paragraph. It should look soething like this:
(using tabs stops every three characters)

This is a test. Ignore it and it will go away. My name is Luca, I
live on the second floor. The quick brown fox jumped over the lazy
whaterer and they all ived happily ever after.

In reveal codes, it would look like:
[TAB][INDENT][TAB]This is a test. Ignore it and it will go away. My name is L
ca, I[Srt]live on the second floor.....

By the way, don't try to use margin release until you have a VERY good hang
of how WP works. It can really screw with your mind. By the way, NEVER use
spaces to line things up in WP. It will always screw things up. I'm sorry
if this is a bit too basic, but better safe than confused. I just completed

another 35 page document last night in WP and it seems that I learn something new to do with it every time. It's a slick program, you just have to learn it language. But it is a VERY powerful language.

BTW, make sure your tab stops start AFTER your left margin, usually ten. If your tab stops are 5, your first stop should be at 15.

01659@AECLCR.BITNET (Greg Csullog) writes:

>I ask ONCE AGAIN. If the STE supports large screen monitors, like the
>MONITERMs, can I get the full rez (1024x768) on an OMNIMON Rainbow
>multisync. If so, HOW!!!!!

Taking this tone does not help you get an answer. This is the first
time I have seen this question come up, and I'm answering you in spite
of your tone mainly as an excuse to ask people to be more considerate
in the future.

No, the STe can not drive a Moniterm or similar monitor directly. The
video signal for that kind of monitor is totally different from the
normal ST/STe video, and requires extra hardware. There is an add-in
board available for the Mega which has this hardware. Since the STe is
in a 1040 case, without the room or stakes for this kind of board,
it's not available for STe. We do have plans for a future STe with
enough expansion capability to make this possible, but the details
are not public yet (and I don't know them).

The TT does support Moniterm-style monitors directly. It has that
extra hardware built in, in addition to other new video modes, plus the
three ST video modes for compatibility. All the modes except the
1024x768 Moniterm-style mode are usable with the same type of monitor.
That monitor is *like* VGA, but the timing is a little different, so an
off-the-shelf VGA monitor will look funny (i.e. picture too small and
not centered, or something like that). If you buy the monitor from us,
it will work (of course). If you buy a multisync monitor, it will come
with enough adjustments that you can make it look good. Your ST
monitors will not work with a TT.

>Can someone from Atari also post the specs on the SIMMs the STE and STACY
>are supposed to use?

I don't know them. The SIMMs are there mainly for the cost and space
savings on the PC board, not so you can add memory to your machine.

In some machines the memory is not even socketed: it's SIPs, not SIMMs.
If the cost of SIPs is lower than SIMMs plus sockets at the time we
buy, we use SIPs.

Message-ID: <"90-02-13-18:51:01.98*UK14"@DKAUNI2.BITNET>
Source record: 243594

In <90021118332768@masnet.uucp> Calvin Bruner asked for a program,
which allows data transfer between Portfolio and ATARI ST using
the parallel interface.

As far as I know, there is a technical problem that makes it
impossible to use the parallel port of the ATARI ST. The Portfolio-
interface uses the paper-end signal (I think for handshaking). The
pin which should handle this signal is not connected in the ST's
parallel port. So I think the only way to use the parallel interface
to transfer data between ATARI ST and Portfolio is to write a new
transfer program for both computers. I don't know if ATARI is going
to write this program.

writes:

> Since that posting, I formatted drive C: with MS DOS but I could
> not get PC Speed to boot from hard disk. Was that because I reran
> HINSTALL to have the ST boot from C: as well?

Yes, that's it!
If you want TOS to boot from C:, you cannot tell PC-SPEED to boot
MS-DOS from TOS-drive C:. The PC-SPEED-software reads the MS-DOS-
system-files from DOS-drive C:, which can be set to an arbitrary
TOS-drive (e.g. D:). So all you have to do (assuming MS-DOS
boot-drive is TOS-D:) is:

1. Run PCS_INST and tell PC-Speed that you have a harddisk (do NOT
select 'HDBOOT') and attach MS-DOS drive C: to TOS-drive D:
(other connections as you would like to have them)
2. Run PC_SPEED and boot MS-DOS using your boot floppy-disk.
3. Try to switch to drive C:. It should work - and the contents
should be the contents of your TOS-partition D:.
4. Format MS-DOS-drive C: using the FORMAT-command. Don't forget to
use option /s to install the system files on your boot partition.
FORMAT deletes the information which was stored on MS-DOS-drive C:.
Make sure that you have copied your important files to another
partition or disk, before you format the partition.
5. Leave MS-DOS and rerun PCS_INST. Tell PC-SPEED that you would
like to boot MS-DOS from your harddisk (i.e. select HDBOOT).
6. Run PC_SPEED and press RETURN without inserting a boot disk.
Your computer should boot from your harddisk.

By the way, you should NOT allow PC-SPEED to access harddisk
partitions which are smaller than 4.2 MB, because MS-DOS cannot
handle them. It could cause data loss!

From: kawakami@ocf.berkeley.edu
Message-ID: <34302@ucbvax.BERKELEY.EDU>
Source record: 243503

I STILL have yet to get my floppy "upgrade" working. What I have is:

Toshiba 1.44M drive
The parts of an Atari SS/DD drive

What I want to end up with is:

A DS/DD drive (for now)

What I have ended up with is:

A SS/DD drive using the 1.44M part.

The problem appears to be the fact that the head/side select line on the adapter board in the Atari drive unit (the little board behind the actual drive) does not have that signal connected to the drive. There are some traces leading from the corresponding pin on the fat atari cable through the board, but the pin going from the board to the drive is not connected.

I checked the signal levels and it appears that when side 1 (of 1 or 0) is selected, the drive stops moving the head around.

I also tried connecting the line from the computer to the drive directly, but this did not work.

Any clues anyone?

PS. I've already done the pin 10 - pin 14 jumper and I can get SS/DD performance.

I just ran into this virus yesterday and it is not even in the general sense
harmless! It ate two of my disks last night before I could isolate it and
kill it. I figured the first disk, my WordPerfect document disk, had gone
bad but the second disk made me suspicious so I ran the *excellent* vkiller
program on it and discovered that I had the key virus on both the dead disks
and some "undead" disks as well. I tried to recover these disks with Norton
utilities, which always has recovered all but a few of the files on a toasted
disk; it would have nothing to do with it. It created some files but they

were bits and pieces of multiple files. I've devoted this evening attempting to figure out what happened. I took one disk which still had the "harmless" key virus on it and copied just the files off. I also installed the hospital utilities just to see if they worked - it did very well. Anyway, I then made this the test disk and formatted a new blank disk. I discovered that when I booted off the "undead" disk, it suddenly became dead and gave a read error on the disk. When I inserted the control disk, which had tested safe, and pressed retry, it didn't do anything. When I displayed information on the control disk, it read and probably wrote to the disk. I ran vkiller. It couldn't read the test virus disk and said the control disk now had a virus. By determination and disk switching, I finally got the test disk to read. It said it was virused, had eight sides and 119538576 bytes total of disk space. By examinig the sectors, I discovered that Key had written over the directory sectors of the disk. It was very dead. So, it would seem that the key virus is *NOT* *HARMLESS*. All I can say is install the hospital programs and hope and pray that the bozo/moron/idiot scumball/50 caret moron(s) who wrote this virus doesn't make one that messes with my hard drive. It would be time to play "Hunt down & destroy the pesky little virus hacker" (New...from Nintendo!).

A tremendous Thank You to George Woodside for his excellent vkiller program!

> Dcache does all of the above. (sync via 'dcache =f' if i remember
>correctly, or via the supplied ACC). It can optionally *not* write
>through.

Correct.

However if you want to use dcache on a floppy
you have to be careful (the manual also warns for this):
- Don't change floppies without 'invalidating' and syncing the cache
for a floppy.
- Formatting a floppy from the desktop with a cache for the
floppydrive turned on fails.

1684. Bug in TURBO-C V1.0

Newsgroup: comp.sys.atari.st
Date: 1990-02-14 10:37:03 UTC
From: joep@tnosoes.UUCP

Look at this C-code:

```
#define MAX -32768

main()
{
printf("1: %d\n", MAX);
printf("2: %d\n", (int)MAX);
}
```

Result:

```
1: -1
2: -32768
```

```

>
> Thanks
> Bill wao@cbnewsm.att.com
> wao@aloft.att.com

I originally got zoo from terminator (the file zoobin.arc, if I recall) and have had very few problems...and these problems have been caused by doing a file transfer in the wrong mode. A typical sequence for me might be:

ftp a file from an internet site to the local VAX
kermit the file from VAX to ST (using Uniterm)
unzoo the file

As long as I remember to use binary as the type, things come out OK. For the FTP part, this usually means SET TYPE I; on the VAX end of Kermit, it's SET FILE TYPE BINARY. In Uniterm, binary is an option on the Kermit dialog box. One check that helps when FTPing - the number of bytes transferred should be equal to the filesize (if the host lists sizes in bytes, e.g.Unix). If the counts don't match, you _will_ get CRC errors.

Hope this helps - feel free to email with questions.

[more fonts with 1:1:1:1 correspondance]
> ATTP10LS.FNT

> 31r META.SYS
> ATSS10MF.FNT
[...]
> ATTP10MF.FNT

Why do you have this last set of fonts here? I've never seen that done before. Anyway, the only real problem UniTerm should be giving you is if it can't find META.SYS or SLM804.SYS. These must be located in C:\GEMSYS.SYS\ or bad things will happen. It also doesn't hurt to tell G+Plus to load ASSIGN.SYS before running UniTerm. If none of these suggestions do the trick, you should probably get in touch with a GDOS expert. There's more on your side of the pond than on mine!

By the way, the metafile converter might show up soon. I had to figure out how to post to binaries. It's always difficult the first time.

My mouse (early 86 vintage) appears to be of the second type (metal rollers, sliding door); it is marked as made in Japan. About 2 years ago I had to degunk the rollers (simple operation: Qtips and rubbing alcohol), but that's the only maintenance it ever needed. BTW, up until then I had only used the mouse on a bare desktop; shortly after that I acquired a mouse pad and have since had no gunk problems, although why this should be so is not entirely clear to me.

1689. PC SPEED problems

Newsgroup: comp.sys.atari.st
Date: 1990-02-14 12:03:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <90Feb14.070736est.57736@ugw.utcs.utoronto.ca>
Source record: 243527

After a few days of limited experience with PC Speed I have come across two very *serious* problems.

(1) Every 3rd or 4th time I try to boot PC Speed, the video gets broken up. Instead of seeing seeing the message to insert a DOS disk, I see something like

..... where the pixels of the characters are speard apart.
.. .. Following this, the system locks up.
.. .. <---representation of letter D with pixels spread out
.....

(2) If I run Word Perfect or dBASEIII Plus, everthing starts OK but as soon as I try some speedy operations, the system locks up or I get a stack overflow message. For example, pressing F3, F3 brings up WP help and typing the letter A brings up a help screen for functions that start with A. If I type A, B, C, ... quickly to switch topics, LOCK UP. Same thing with dBASE's ASSIST mode - if I switch menus quickly, I get a stack overflow message. NORTON's Change Directory will give a stack overflow message everytime I attemp to change directories.

When I tried to install PC GEM/3, I would see

>New installation
Change existing

Then I would see

>C
D

Next, when the screen to select a graphics card popped up, the computer would lock up.

Can someone on the net who lives in Germany pass this info on to SACK, the creators of PC Speed.

I may just have a buggy board. If not, if this is typical of PC Speed, my recommendation is avoid the product at all costs. Hopefully, someone on the net (maybe someone from Michtron, the US reps) can help me out and solve these problems.

1690. How to boot from external drive?

Newsgroup: comp.sys.atari.st
Date: 1990-02-14 13:22:28 UTC
From: craig@scol.UUCP
Message-ID: <9002141716.aa00709@flopsy.specialix.co.uk>
Source record: 243530

I have just bought a 1M external 3.5" floppy for my 520STFM,
and everything's hunky-dory except I can't run some games
that expect to be booted rather than double clicked.

I've heard that there are two options - fitting a switch
in the ST to swap the drive select lines, or a PD utility
that allows a warm-boot from drive B.

Can some kind soul help me by either telling me whereabouts
the relevant lines for the switch are on the circuit board
(mine is Rev D), or mailing me the utility?

I'd appreciate a quick answer on the hardware question,
since my machine is in bits right now while fitting a
memory upgrade, and I'd like to avoid the hassle of putting
it back together and then taking it apart again!

1692. Substance under keys

Newsgroup: comp.sys.atari.st
Date: 1990-02-14 13:33:57 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <2077@rodan.acs.syr.edu>
Source record: 243365

I had been noticing for a while that there was some sort of brownish/beige greasy substance under my "return" key, and last night I finally decided to investigate. I popped up the right shift key and the return key (that was an adventure, since I wasn't sure how much pressure to exert) and found two metal "hooks" that were inserted into little white plastic pieces that themselves were inserted into the keytop. This greasy substance what smeared over these metal pieces in the plastic, and I guess it had begun to melt/run(?). That is why I saw it under the keys. I wiped it up a bit and returned the keys...now I'm just curious...what is this stuff? and what is its purpose? (It seems almost like pipe fitting grease.)
Replies to the net will be fine.

On the Atari, when you hit a key, the keyboard uP sends a 'make'
code via interrupt to the 68000. When you let off of a key, a 'break' code
is sent. If for some reason (fast typing?) the 'break' code for a key
never gets sent, the 68000 will think that the key is still being pressed
down.
I ran into this problem when trying to disable all interrupts for
a long period of time. The 'break' code got lost and so the keys just kept
coming until you pressed another one.
Is this a resonable explanation??

1695. Re: Need explanation of ICD error-message !!!

> After a long time without any problems I now get an error-message once in a
> while.
> The ICD harddisk-driver says SENSE $16 or SENSE $17 in the top-line of
> my desktop.
> Who knows what this message means and if I'll get into trouble reading my
> data from the drive ????

THIS IS SPECULATION:

The Adaptec/SCSI standard has error codes assigned. They are returned to the driver when something goes wrong. If it were by driver, I would print them. Hex 16 and 17 are "NOT ASSIGNED". But the group 10-18 are for reporting bad things. Thus I think 16 and 17 are bad also.

From Adaptec 4000A Manual:
Error codes:
10 ID CRC ERROR
11 Uncorrectabel data error
12 ID address mark not found
14 Record not found
15 Seek error
16-17 Not assigned
18 Data check in no retry mode

I have been infected by a virus. Using VKILLER 2.2 I have learned that I have the 'Key' virus that everyone is talking about. It is waiting for a certain disk to be inserted before it does its damage. Thankfully, I never inserted that disk. By the spread of the virus (about 25 of my disks) I have determined that I have had the virus for about 3 weeks. Now, I probably still have the program that generated the virus in the first place. Is there any way to test for that? I'd like to determine where I picked it up from.

1697. XEDIT-type editor for ST

Newsgroup: comp.sys.atari.st
Date: 1990-02-14 15:58:12 UTC
From: BGB100@psuvm.psu.edu
Message-ID: <90045.105812BGB100@psuvm.psu.edu>
Source record: 243369

Hi all:
With working on an IBM mainframe everyday at school, I have grown a bit used to the XEDIT editor. I am interested in making an Xedit-type editor for the ST, with the same kind of power (macros, full configuration settings, etc.) I know that a commercial product exists for the IBM PC series of computers called Kedit (Mansfield Software). Does anything exist like this for the ST, either PD, shareware or commercial? If something like this does exist, can someone please give me references to companies or FTP/mail sites to get a copy? Any help would be appreciated.
By the way, I know Kedit works on an ST running PC-DITTO; it's slow, but it works.
On a related note, is there anything similar to REXX available for the ST? That's another idea that has been brewing over in my mind for a while now too. (I know...if I want a mainframe environment, use a mainframe. But I like my ST!)
Thanks all! I hope something good can come out of this!

Bruce Blanar

/* If anybody outside 'dnet' and 'sub' can read this, PLEASE tell me. I tried
to restrict the distribution to sub,dnet. */

Hallo allerseits,

Ich hab' hier eine SCSI Platte, die ich an meinen ST anschliessen will.
Dazu brauch' ich nun ja einen Hostadapter, der das (WUT) ACSI Interface
des ST auf SCSI bringt.

Was ich nun von euch :-) wissen will, ist folgendes:

Wer hat Erfahrungen mit den verschiedenen Geraeten, die man so kaufen
kann - mir sind bisher nur die Bausatzloesungen von c't, ST Computer und
ST Magazin bekannt.
In comp.sys.atari.st wurde das Thema zwar schon angeschnitten, es ging aber
immer im amerikanische Geraete, die hier wohl so nicht erhaeltlich sind.

Also: - Welche fertigen Adapter sind auf dem Markt?
- Wie ist die Ausstattung (Kabel, Treiber, Doku, Netzteil, ...)
- Wie zuverlaessig ist das Ding?
- Preis?
- Bootfaehigkeit von der Platte?
- AHDI kompatibel?

- Wie sieht's mit den Selbstbauloesungen aus?
- Wie zuverlaessig sind die?
- In welchen Ausbaustufen kann man sie haben (Leiterplatte, Bauteile,
fertig bestueckte Platine, Fertiggeraet)
- Software?
- Preis?

Falls sich tatsaechlich jemand dazu aufraffen kann, mir zu antworten,
dann bitte per e-mail, ich werd' das ganze zusammengefasst posten (es sei
denn das ist nicht gewuenscht ;-) ).

Ich bin zu erreichen unter: me@dude.pcs.com (fuer ganz schlaue mailer)

1699. Manipulation of Courtroom Evidence

Newsgroup: comp.sys.atari.st
Date: 1990-02-14 16:40:38 UTC
From: wniren@pyrtech
Message-ID: <102034@pyramid.pyramid.com>
Source record: 243371
Cross-posted to: comp.sys.amiga,comp.sys.atari.st,ba.general

Hi. My friend is a 2nd year law student and she is working on a fascinating project with which she needs a little help.

Basically, she is investigating the impact of recent computer graphics technology advances on the use of video and photographs as courtroom evidence. As many of you may know, it has been possible over the past few years to manipulate photographs and videos at a bit-level using new generations of graphics computers. The results are that you can completely alter what these media display.

A somewhat recent example is a past National Geographic magazine where the editors actually moved some scenery closer together on the cover photo to make everything fit in the small space available. This was done using some expensive computer equipment which digitized the picture enabling them to manipulate the photo so well that the modifications were completely undetectable.

To take this further, the equipment to do this type of work has been very expensive in the past. Now, with machines like the Amiga and the Atari ST, anyone with a few thousand dollars can do this kind of work.

Photos and videos are still admissable as courtroom evidence in most situations. However, with these new "advances", can we trust these forms any more? Think of the impact..a criminal could possibly be let loose based on a photo showing someone else perpetrating the crime. Newspapers and TV networks could change what the public sees. We're talking about a tremendous potential for "disinformation" to quote our wonderful government (by the way, isn't that a fancy word to mean "to lie"?).

So. What we need is information of a technical and intellectual nature pertaining to this topic. Is there software available for these inexpensive machines to enable average people to do this? Has anyone seen examples of this kind of manipulation? etc.

Thanks in advance and please cc replies to my mail address:

From article <1990Feb3.070418.13493@gumby.cc.wmich.edu>, by obryan@gumby.cc.wmich.edu (Mark O'Bryan):

Useful explanation deleted here (saying that formdial saves the screen behind a dialog box, eliminating slow redraws when dialog box is removed).

> Most programs work OK with FormDial, but some don't and will hang, probably
^^^^^^^^^^

UIS III also eliminates screen redraws when it disappears using the same idea. However, the feature is optional because - as the manual points out - some programs are written badly and *depend* upon the call to redraw the screen to realize that the "dialog" is over. Time Works Publisher ST is mentioned specifically, and some others that I forget. I expect that this is the bug that hangs programs with formdial. If this is what you meant by not balancing calls, it wasn't very clear.

On a related note, what *is* the proper procedure in calling and returning from dialogs - one that doesn't check for a screen redraw?

> because they got sloppy and don't balance their calls to formdial properly
> (just my guess). Whether it's worthwhile for you will depend on how tight

>files, can anyone recommend any music programs that will play .sng files?
>--

Yeah, how about Music Studio? :-)

There was a PD .sng file player, but it wasn't very good.

This is assuming we're talking about Music Studio .sng files; I seem to remember there being another program that used .sng as its extender.

I had the identical experience recently.. and my opinions
were much the same as Richard's.

Frankly, condidering
the state ATARI is in these days...
Seems more reasonable to make the developer's kit
robust, cheap and thorough.

ATARI needs to attract as many good developer's
as possible. All i read regarding developer
support is a great sense of frustration and
resultant indignation.

Can ATARI "afford" to be this way?

> }
```

This is not a bug, its a feature. MAX is not a number, its an expression. Thus, the evaluation of MAX is a long int. The first printf only prints the high word of the long int MAX. The second printf properly casts the long int to an int and prints the correct result. Try:

```
printf("3: %ld\n", MAX);
```

> / | \ ______/ / : .edu
> Call the A.C.O.R.N BBS (716)436-3078, 300/1200 baud :<-or my BBS

Not True, details of the modifications necessary were posted in this
group by the designer (I believe) in December 1989.

If I get enough requests (say 10 or more) I will repost the pertinent
bits (edited that is, to save BW, is that ok Hase?) Email requests (on
internet) to pegram@griffin.uvm-gen.uvm.edu

I make no guarantees, as I haven't had the time to do the mod myself
yet, but it does make sense. The basic idea is to double the clock to
the 1772, then set your seek rate to "6msec" (= 3msec for a 16Mhz clock).
There are 1 or 2 gotchas that can come up (hey, it happens with 720K
drives too!) and you are clocking the WD1772 beyond its design limit
(10Mhz limit, 16Mhz actual).

I must concur. I like the light touch of the ST keyboard. I can also touch type and find some of the IBM keyboards (especially the 'XT') type terrible to use. I also don't like the click that so many people seem to require.

About the only improvement would be some marking of the 'home' keys (f & j) as I sometimes get going 'out of sync'

Re : <9001150805.AA1590@ucbvax.Berkely.EDU> on 24-pin font editors

You need Fontkit Plus, which allows you to edit GDOS fonts, downloadable printer fonts and .RSC free images. It covers a huge range of printers, and this includes the NEC P6, _all_ Epsons and compats. and a few more esoteric printers.

It is an excellent font editor - easily the best font ed. for the ST (excluding the Calamus font ed.) It really does have too many features to mention here. It is published in the UK by an ST user group, for the princely sum of 15.95 pounds stirling, from

The ST Club,
49 Stoney Street
Nottingham, United Kingdom
NG1 1LX

disclaimer : I have no connection with the writer of Fontkit Plus, nor with the ST Club - it's just a damn good program.

Re : <9001122253.AA25532@ukcbvax.Berkley.EDU> Home of the ST

If there is a true home of the ST, then it must be Germany. The wealth of products available and the esteem in which the machine is held is incredible. In the UK, we have similar problems getting all those products released. For example, a friend of mine in the ST business has tried extremely hard to get Turbo C/ST released over here. He would have done all the manual translation, layout, publicity etc. himself, but Borland/Heimsoeth in Germany say that Borland UK have Turbo C/ST and they can't do anything about it. Borland UK do not want to be associated in any way with the ST, to the point of paranoia. It would be funny if it weren't such a crime.

As far as machines _actually shipping_ goes, the current status is

520STEs are arriving in volume. This was something of a surprise for the dealers, who ordered ordinary 520STFMs and got STEs instead! I have yet to see a 1040STE, but that doesn't mean there aren't any.

The TT _IS NOT SHIPPING IN VOLUME_, contrary to reports I read in this newsgroup. I don't know of any developers who have machines.

TOS 1.4 is not shipping either. Every time you ask Atari UK about this (assuming you can find anyone who knows) you get a different answer. A lot of people are _very, very_ annoyed about the delay.

The magazine ST World will be running a series on programming the STE soon (probably starting in the April edition). I covered STE DMA sound in my "Programmer's Clinic" column for the March edition. You can get ST World in the USA and CANADA, as well as most of Europe. Similarly, I had someone cover the correct generation of GEM Metafiles in the current (February) edition. I will cover more on the STE hardware in later issues.

I have good Atari technical documentation for the STE. I cannot see any reason for not posting it to this group, if anyone is interested.

As of 3/2/90, Gollner Publishing (which produces ST World) has been merged with the Database group of magazines, forming a new company, Interactive Publishing. This now means that Interactive Publishing owns ST World, ST Action, Atari ST User, Amiga Action and Amiga Computing. I do not think the new company will continue to run five magazines when it can get away with two.

Therefore, I do not think that ST World will survive for long (the owners of the Database group, Europress, own Interactive Publishing).

Re : HiSoft WERCS

The version I have is 1.12, dated March 1989, and it works for me

This is my second attempt at a posting - hope this one makes it...

Frontier _is_ a UK company. They started out as the UK supplier of Supra hard discs. They now also supply a large range of memory add-ins:

Basically, you buy the Xtra-RAM board, and add as much memory as you like. The prices are as follows:

Xtra-RAM board, unpopulated : 69.99 pounds
Xtra-RAM plus 1/2MB RAM : 99.99 pounds
Xtra-RAM plus 2MB RAM : 299.99 pounds

Postage and packing are _EXTRA_. They take Access and Visa, and can be contacted at:

Frontier Software
P.O. Box 113
Harrogate
North Yorkshire

> the lower cost option??

The main answer is to squeeze out the non-serious developers. I doubt that
Atari even broke even at $100 for its new support.

Remember, developers can buy Atari Hardware and the MWC compiler at a discount,
as well. That plus the "freevies" they thrown in as of late makes it a good
deal, even at $250.

Heck, if you really want to make a difference, don't just write a letter,or make an announcement saying you're clean, the pirate boards just laugh in your face anyway, what do they care?

Heck, just infiltrate the bloody organization, and format their hard disk, or palm an indistrial magnet, and run them over the disks....

Plant worms, viruses, program new viruses to screw up their systems. Do something, rather than point and hope someone does something.

Besides, *DON'T* believe all the "we're clean" postings, as here in Sacramento, an Atari BBS had a "secret" download section full of pirated Atari software, while they claimed that they do not condone pirating. See, what do pirates care? Unfortunately, although I was close to breaking in, I was cut off... I was close though...

Subject: Becoming an Official Atari Developer!

Richard E. Covert Comments on becoming an Official Atari Developer:

>I called Gail Johnson in early January 1990 to inquire about becoming an
>Official Atari ST/TT Developer. I was sent a large envlope withing a
>week. The envelope contained a description of the current plan which is a
>single level plan costing $250.00. The Developer MUST be developing a
>COMMERICAL product for the ST. The Developer MUST submit 3 copies of said
>product to Atari Corp. the Developer MUST re-register annually. The
>packet I received said a LOT about what the Developer must do, but very
>little about what the Developer receives for his $250.00.

>Basically, all the Developer gets for his $250.00 is some mailing lists
>from Atari Corp. And the option of having his products (demos thereof)
>being distributed by Atari Corp to all Atari dealers.
.
.
.
>So, as of Jan 1 1990 there is only one Developer Program which costs
>$250.00. And it doesn't even include the MWC C compiler. It contains the
>OLD OLD Alycon C compiler, which I have heard is VERY VERY bad.

Maybe I can shed some more light on the situation. Like Richard, I was also confused by Atari's new developer contracts and discussions. Developers can now get good discounts on Atari hardware, but I didn't know if I qualified, since, although I was an official developer for 4 years, I had no commercial product. No one in our ST computer club knew either.

So, a few days ago, I called Charles Cherry, the manager of Developer's programs at Atari (408-745-2082). Things are still a bit up in the air, since he has only been on the job for a few months, and he is still attempting to expand benefits. But here's how things stand so far.

There are now TWO classes of developers - one that is developing a commercial product(s), and one that is chiefly developing for oneself. Unfortunately, there are no specific names to attach to these two classes - they are working on that. For convenience, I'll refer to them as commercial and non-commercial developers.

For either class, you send in your $250 with a non-disclosure agreement, and in return you get:

- a developer software kit supporting the ST, TT, and STe
. Alcyon C compiler
. MADMAC assembler

. Debugger
. Linker
- a newsletter subscription
- online support

If you are a commercial developer, you also get:

- customer registration address database
- marketing support

Mark Williams C is not included, but available separately for a discounted price of $99.

Why become an official commercial developer? Well, mainly because you get some hefty discounts on Atari hardware, as well as extended marketing support. Atari is doing this to encourage the generation of new software products in the marketplace.

You are probably wondering what you need to do to become a commercial developer. First of all, if you have been a developer, you are "grandfathered" in, and have no problem. Otherwise you have to apply fresh, following these guidelines:

1) You must have a commercial product

2) Shareware definitely qualifies as a commercial product

3) Having your program published in some magazine qualifies

4) Public domain submissions generally don't qualify

5) If you are just starting, you most likely won't have any product yet. In that case, you must submit a business plan, describing the product you are working on and the timeframe for release.

Of course, you could try to lie like crazy, pay your $250, and go for the discounts, but Charles says Atari will periodically review applicants and remove them from the list of developers if no product appears to be forthcoming. (I expect policy updates here, since policing this could turn out to be a nightmare.)

All in all, I got the impression from Charles that Atari was really serious about its claims of increasing developer support. I know I've received several developer updates recently, each of good quality. In fact, I'd say developer support was probably better now than at any time in the past.

Charles also says to be sure to write him on suggestions. For example, he recently asked a group of developers what kind of UNIX they wanted on the TT. In spite of the wide audience, he only received two responses! Hearing this, I asked if he monitored USENET (where he would get an earfull). He said that while he didn't, there were others in Atari who did monitor it (such as Ken Badertscher).

Oh, incidently, I asked him about the developer mailing that I recently received whereby I got several disks of address data of all the ST buyers that sent in their warranty cards. He said this was confidential developer info, and couldn't be given to Atari clubs. On the other hand, it was OK for the developer to make up mailing labels from these disks, and for the developer to send out club meeting announcements along with any product advertisements.

Finally, while I tried to accurately convey the significant points of our conversation, I no doubt omitted an important thing or two. You may want to talk to Charles Cherry yourself to clarify some issue. Give him a call - he seems friendly enough to talk to.

>parent directory from the desktop but not within a disk utility program
>like DLII.

Word Perfect maintains it's own virtual directory information in temporary files (at least, the ST version does). Why it does this I'm not sure (ask the programmers :-), but if at some point it can't find its temporary files, it gets real upset and starts cross-linking _your_ files, messing up directories, etc. This is a common problem on floppy-only systems, particularly systems where memory is at a premium and the user is tempted to set WP's virtual directory to the floppy.

If no virtual directory is specified by the user in WP_START.PRG, then WP automatically sets up a ramdisk of 30K or so and saves its temporary files there. If you're short on memory, you can save the 30K by setting the virtual directory to A:, say, in WP_START.PRG. (Setting the virtual directory to A: also allows you to edit large files that won't fit into memory all at once; 30K isn't enough room for WP to spool the virtual file into, but there's usually plenty of room on the floppy.)

God help you, though, if you have the virtual directory set to A: and you swap out the disk that has WP's temporary files on it. You're virtually guaranteed to have problems with cross-linked files, etc., and the problems are virtually guaranteed not to show up until later. I.e., the files you're editing will appear to save OK, you can continue to edit them, save them again, exit WP, whatever; but the next time you load them into WP, they're trashed, along with probably 80% of whatever else you had on the disk. (Believe me, I learned all of this the hard way.)

I keep WP's virtual directory set to D: (a 200K ramdisk) on my 1040ST, and have _never_ had a problem with cross-linked files or anything similar. If you have a hard drive, set the virtual directory to one of its partitions and you shouldn't have any problems either.

If you absolutely MUST set the virtual directory to a floppy (I sometimes do this on my wife's 520ST floppy-only system at home, when I need to edit large files), proceed with extreme caution. DO NOT under any circumstances simply swap out the floppy and put in another one in order to save a backup copy of the file or anything like that.

If you only have a single drive and you desperately need to access a different floppy, make sure that you refer to the other floppy as B: (assuming that the virtual directory is set to A:) -- e.g.: Shift-F10 will give the the "Retrieve File" dialogue; input "B:\yourfile.ext" and the system will prompt you to insert the other disk. Just to be on the safe side, hit F5 ("List Files") as soon as you're done retrieving the file from the B: disk, and the system will prompt you to re-insert the A: disk so that WP gets its temporary files back. Hope this helps, BBB

Subject: Re: more drive woes
Newsgroups: bit.listserv.info-a16
References: <INFO-A16%90021408333148@MARIST.BITNET>

In bit.listserv.info-a16 you write:

>I STILL have yet to get my floppy "upgrade" working. What I have is:
>Toshiba 1.44M drive
>The parts of an Atari SS/DD drive

What kind of sigle sided drive?
Is it one of the SF354 that has an 8049 microcontroller on the little PC board adapting the STs version of the Shugart bus to the 'real' bus?

This microcontroller does a lot of weird things, it seems.

To connect Your Toshiba drive to the St just build a cable from Your old round cable: cut off one of the round connectors and connect a 34-pin connector to the wires. That should be not to tricky.

If You need the specs for the cable, look inside the ST manual (description of the floppy output) and compare the signal names to the signal names in the drives manual (or write to hase@netmbx.mbx.sub.org :-).
Maybe You want to use the old adaptor-PCB to adapt the power connector, but build You own "adaptor" cable to connect the drive.

>I also tried connecting the line from the computer to the drive directly,
>but this did not work.
Well, I suspect very much, You have the microcontroller controlled drive.
The 8049 does some sort of "consistency check" on the signals and stops the drive, if he doest like the combination of input signals; for example, it is impossible to make an unmodified SF354 work with the BLITZ copier cable, cause this asserts both drive select lines at the same time: the 8049 thinks, they must not be asserted at the same time...

>Any clues anyone?

>PS. I've already done the pin 10 - pin 14 jumper and I can get SS/DD
>performance.

Hmm, say nothing to me. What does this do, and where is it done??

I just spoke to Charles Cherry about becoming a Developer and was told
that Atari is changing the Developer program. Currently, there is only one
level, that of Commerical Developer, which costs $250. This is down from
$300 in 1989. this includes the Atari Docs and the Alycon C compiler. The
old package, which cost $50 more , included the Mark Williams Corp C compiler.
The MWC compiler was dropped since most developers already owned a compiler,
and didn't need it. Charles told me that the MWC compiler can still be purchased
thru Atari (as a developer) for $100. sounds fair to me.

Charles did say that Atari is trying to make a Non_Commerical Developer class,
but that it is not announced yet.

So, there is NO "documentation only" developer package, but the Full Commerical
Dev Package has benn dropped to $250.00.

As always contact Gail Johnson at Atari Corp for more info.

1716. ATARI ST 520FM for sale

Newsgroup: comp.sys.atari.st
Date: 1990-02-14 19:52:55 UTC
From: rosalia@max.sunysb.edu
Message-ID: <1990Feb14.195255.18204@max.sunysb.edu>
Source record: 243547
Cross-posted to: misc.forsale,comp.sys.atari.st

First I should point out what the FM is: it is an Atari 520 ST with
the floppy drive built in, instead of external, and with an RF modulator.
It also has the power supply INSIDE.

I bought this in 1989, to replace my old 520, which died, and am
impressed with it, because it does not have all those cables and power
supplies sitting all over the place. But I ended up not using it
because I use my UNIX PC all the time.

I also sell a double sided external drive (so you have a double and a
single). The double sided drive and the monitor are both older.

I have some disks of software, and if you read the net, you will find
a lot of better stuff in various archives.

So here is the scoop: I sell

-- Atari 520 ST FM
-- Monitor
-- Internal single sided drive
-- External double sided drive
-- Various disks with PD and commerial software
-- Manuals

You pay exactly $400 or best offer for the whole thing, including UPS COD
charges.

This was originally mail for Rob DeMillo (if he's still
out there), but netmail keeps bouncing it. In addition,
it's got some info that other people might find useful...

Rob,
Dave Beckemeyer sells a UUCP package that works with
his Multi-tasking C-shell. It allows you to become
a UUCP node in your own right (of course, you have
to get someone who'll give you a feed...) I've
recently gotten the software working, and it's
cool! Just set your machine up, and the software
does the rest... (You _will_ become knowledgeable
in the ways of the sysadmin, however! <grin>)

Who is asking the dealer to "send" anything. I think we are talking
about walk-ins here. My dealer did not ask if I intend to take
my machine to the US. I know of another who may have contributed
to the current shortage of Mega ST2's in the US by purchasing there
and carrying with him to a third country.
None of these activities are illegal, nor should they endanger the
status of a dealership.

Good grief.

1722. Great games on the ST

Newsgroup: comp.sys.atari.st
Date: 1990-02-14 22:49:07 UTC
From: boyd@fsucs.cs.fsu.edu
Message-ID: <9002142244.AA20559@fsucs.cs.fsu.edu>
Source record: 243385

Well, I have not heard about any games on this newsgroup for awhile, so here are some new ones that I have seen that are really good.

1. North and South: this one got a higher score than Dungeon Master in the british magazine ST Action. This is significant, those guys are very discriminating with their games. A semi-strategy graphics masterpiece, good sound and humorous. Based on the Civil War.

2. Blasteroids: Arcade conversion, very good. Kind of like "Super asteroids meets the transformers." Pure shoot'em up, perfect for someone who has no time for adventures.

3. Full Metal Planet: Strategy type wargame, very good graphics, extremely good sound. Futuristic robot ships fighting each other, up to 4 players either computer or human. Really unique, really fun.

Disclaimer: I have no connection to the authors of the above works, nor do I or anybody I know own a computer store. These are just great games that deserve to be bought.

Source record: 243549

Alan Pratt wrote that he was irritated at my request for info on the STE and multysyncs. Alan, the request was general, not aimed at you explicitly so there's no reason to take offense.

When I had problems with an STE and Word Perfect I called WP Corp. WP (specifically a tech rep named Mike) called Atari to find out why. Atari USA told him it was because the STEs support large screen monitors and WP does not. Now Alan Pratt says the STE does not support large screen monitors; what gives at Atari?

I was asked to do a review of the STE for Current Notes and I passed along the info about large screen monitor support (assuming Atari knew what it was talking about). I guess I'll have to notify CN and have to issue an erratum.

This all stems from the fact that Atari is marketing a product that no one can get specs on. It's so frustrating supporting a computer like the ST when one has to contend with Atari!

I must say I agree with Richard on this, in fact if the FCC caught wind of this I would place my money on them. IF in fact there is a internal difference in the US STe (or other models) and someone complains(TV, radio, aircraft...etc reception) --> I think the FCC will be a knocking on your door real soon. Also I would guess that the FCC would talk to the border patrol about this for those occasional random checks.

Just remember it IS illegal and if you are caught expect to loose your computer. I would compare it to importing a car from another country that does not have the same emmisions controls. Radio wave polution is on the same order as air, noise, and other polutions; even if we can't see it, it probably will affect somebody!

I hope in the future Canadian dealers will not sell to Americans, I believe it IS risky for them.

PS: I may have posted before with a name '(finger me!)', it was put there to encorage the UNIX command finger(1) not as a insult to anyone.

1727. Re: PCDITTO II

Newsgroup: comp.sys.atari.st
Date: 1990-02-15 03:05:43 UTC
From: whoffman@jato.Jpl.Nasa.Gov
Message-ID: <2848@jato.Jpl.Nasa.Gov>
Source record: 243351

I received my PCDitto II about 2 weeks ago. I installed it into my 1meg 520ST and it didn't work. It hung right after the point where it asks for a DOS disk. By scanning GEnie messages, I found that my problem was not all that unique. The problem seems to be timing differences in the MMU chip in the ST. There is a fix for the problem to change out two PAL chips (in sockets). I have included a copy of the message from Avante-Garde Systems retrieved from GEnie.

Now if we only had the 2-way GEnie hookup active, it could have been here a lot sooner. :-) (I just had to do that, Dave(GBS))

--- following message retrieved from GEnie ---

Category 19, Topic 2
Message 73 Mon Feb 12, 1990
AVANTGARDE at 16:54 EST

Dear pc-ditto II owners,

We are happy to announce we have found the problem with pc-ditto II hardware not working with some STs. We were correct about the changes in timings of some machines being the heart of the problem and our correction widens the tolerance for machines with different timings. We can discuss our findings at a later time in detail, if there are any engineers interested. For now, however, the following describes what to do to receive an update:

1. Correction involves replacement of two socketed chips on your pc-ditto II board. The chips are labeled: U27 GLUPAL (part TIBPAL 20L8-25CNT) and U15 EMSPAL (part TIBPAL 16R4-25CN).
2. Please carefully remove these chips (a flat-edge screwdriver under the end of each chip works best). CAUTION: Please observe static discharge procedures (as noted in the pc-ditto II Installation Manual) to prevent damage to your board.
3. Then, wrap the two chips in a soft packing material and return to Avant-Garde Systems at the following address:
Avant-Garde System
381 Pablo Point Drive
Jacksonville, Florida 32225
(You may call (904) 221-2904 9am to 5pm Mon-Fri if you have questions.)
4. Please include your name and return address.
5. We will return two new replacement chips immediately along with instructions on replacing them.

For owners with pc-ditto II that are already working, replacement of these two chips will not help you. Therefore, we would not recommend "fixing your product if its not broken".

We are now working on a blitter fix and standardized Mega expansion port fixture and will post a message soon about those items.

(Also, if you have already called or written, you will be receiving a letter concerning the above, as well).

Thanks!

Jet Propulsion Laboratory, 4800 Oak Grove Dr., Pasadena, CA 91109

"It better work 'cause after launch, service calls are quite expensive. It's only $40 for the call but it's the mileage that kills you."

There are many genealogy packages available. There are several tolerable PD packages out there, but for $35 you can buy a first-rate package called Personal Ancestral File (PAF) that the Mormon Church publishes. You can order by phone - call the Latter Day Saints' Family History Library in Salt Lake City and they can probably direct you to the right people.

(The Mormons are heavy into genealogy for religious reasons, but they are remarkably nice about helping all us J. Random family historians, too...)

COMMSOFT up in the Bay Area somewhere publishes Roots III, which is arguably the cadillac of genealogy packages. If you buy it from them it will cost around $300 (depending on what utilities you order), but you can save $50 by ordering from one of the mail order catalogues.

I used PAF until I had about 2500 people on file, then switched to Roots because I wanted the fancy footnoting and book-generating features it has. (That's right - Roots III will turn your data into a formatted, publishable family history...)

Incidentally, you might want to check out soc.roots on the net, the roots-l mailing list, and the National Genealogical Conference on fidonet.

Happy hunting for bears! -B

writes:

> In <"90-02-09-11:06:10.92*UK14"@DKAUNI2.BITNET> O. Steinmeier writes:

>>...
>>So, if you know a reliable, fast, cheap (PD or shareware preferred)
>>harddisk backup program, would you send me a message?

> So you want it to be fast, reliable, and do everything but wash the
kitchen sink but you don't want to pay for it???? Typical.

I'm a bit surprised about your reaction. A lot of people answered my
request and recommended TURTLE, so I believe it might be really good.

It's true: I want to use a *fast* backup-program, because I would
not like to spend several hours on saving the information on my
80 MB-harddisk. I wrote a backup-program myself a few years ago and
it was not very fast (but reliable).

It's true: The backup program, I'm looking for, should be reliable.
I hope it will never be necessary to use the backup, but if I need it,
the restore-option should work without problems.

It's true: I'm looking for a cheap program. As mentioned before, I
wrote my own program. I also bought two different backup-programs
with my harddisks - both seem to be slow and/or unreliable. Next I
tried to use the BACKUP-command of MS-DOS 4.01 (my PC-SPEED works fine).
It's really fast and seemed to be reliable, but it also has a bug.
It is impossible to save a file which contains a German Umlaut in
it's filename. Instead of storing the file, BACKUP starts to ask
for new disks permanently.

It's NOT true, that I do not want to pay for the 'perfect' backup-
program. I only asked for a cheap program. Why should I ask for an
expensive one? A shareware product is not free, so your reproach is
is surprising (I always pay the registration fee, if I use the
program regularily). Why should I buy an expensive program, if
I could get a cheaper one (or a public domain program), which is
as good as a commercial product?

In my opinion it's ATARI's job to deliver a useful backup program
with their harddisks (the German harddisk-manual only advises
the proud owner to copy important files on disks).

By the way: In the last 4 1/2 years, I bought (!!) a lot of
software for my ATARI! I do *not* support piracy (if you meant this)!

And I usually manage to clean the kitchen sink myself!

Thanks to those, who gave me helpful hints. And also thanks to those, who answered to Bob Luneskis mail (Timothy Roeder (yes, it's Mr. Steinmeier), H.C. Johnson, etc.) - I appreciated your support!

I think we should stop the discussion, it only wastes time and money (if you would like to continue, email me!).

In <90Feb14.070736est.57736@ugw.utcs.utoronto.ca> (Issue #199)
Greg Csullog reported some problems with his PC-SPEED (the
letter is too long to reprint it here).

The problem which occurs when you type too fast, sounds familar.
You should not use the MS-DOS KEYB-program. The keymap-installation
is done by PC-SPEED itself (choose your keyboard in PCS_INST).
Also you should not use any MS-DOS tools to change the
repeat-rate of your keyboard. I hope these hints will help you.

I can send your info to Hansjoerg Sack, the developer of PC-SPEED,
but I guess it would be useful for him to know something about
your computer model. You can email this information directly to me.

Source record: 243355

I have several questions and I hope someone can help me:

First, is STart mag still out (I know St-log/analog went down recently) and if so, does anyone know why I am having so much trouble finding a copy?

Can anyone suggest a DS/DD ext drive for a 1040st (beside the 314)? I need one that is very inexpensive and something that will hold up. Has anyone heard of the BeaST drive?

How does one get access to PROG-A16? I seem to be having trouble getting in contact with it.

Finally, is there a PD program which lets you display a color (PI2?) picture as the background of your desktop instead of Atari Green? I know one exists for monochrome, but I need color.
Any answers are greatly appreciated

John Jung asked about a "better" GIF viewer...

There's one written in GFA BASIC called GIFNEO which does exactly as John suggested... if the original picture is larger than the ST lo-res screen, it lets you scroll around the picture, with the ST screen as a "window" onto the full GIF picture...

Unfortunately, it's VERY slow to convert the GIF pic, and once converted, the scrolling is EXTREMELY slow.

It DOES do a very good job of converting the colors though, and allows savi the ST screen window as a NEO format file.

GIFNEO is available on CompuServe, and BBSs all over the world...

However, as Mickey Boyd suggested, probably the best GIF converter I've used is the DIGISPEC program from Trio Engineering. It does compress a larger GIF file down to fit the ST screen, and can cut off the top and bottom (although it does let you choose where to center the final picture), and will only save the final picture in SPECTRUM format (which can be a waste if the picture is only 320x200x16colors, as a regular ST lo-res picture is), but again as Mickey mentioned, it allows you to control the Brightnes Contrast and Color Balance of the picture. You can then convert the SPC picture into a regular DEGAS format for the smaller filesize, if you wish.

It's fast, can be run as an ACCessory, and is available as a separate program package from your local Atari software dealer...

Richard Covert asks:
>Also, is there anyway to get linked to GEnie's files?? I d/l quite a bit of
>GEnie files and it gets expensive!!

Forget it, Richard... the people who run GEnie are motivated by one thing,
and one thing only, and it begins with a capital $$

They are no more likely to allow you access to their files (which account
for 60-75% of their revenue) for free, than they are likely to subscribe
to any minimal code of ethics...

Letting you read <giggle> and <tee hee> messages won't cost them anything,
and might even be written off as advertising for their real product, which

A new version of the commercial Assembler package Omnikron Assembler is
now Shareware. The Assembler is named Turbo-Ass. It's very fast (assembly
2.000.000 Lines/minute) and the Debugger it one of the best i ever seen.

Send a Disk and an Envelope to: Frank Simon,
Kennedystrasse 12
2900 Oldenburg
West-Germany (even now)

regards Terra

>access the hard disk (such as disk checkers might do) must understand
>this convention, or else they will get confused by the (apparently)
>negative sector numbers (i.e. any in the second 16 Meg with the
>high-order bit set).

Actually, ATARI did extend the range of sector numbers, but not only
to 2^16 but to 2^32. This is, however, not the reason why partitions
larger than 16 MB became possible. The new ATARI driver supports
larger logical sector sizes. Before, the logical sector size has
been 512 bytes througout all kind of media. Now, the new hard disk#
driver blocks 512 byte sectors to larger logical sectors. A partition
with 24 MB, for instance, has a logical sector size of 1024 bytes.
This trick works with ALL TOS versions, so you don't have to install
TOS 1.4 to use them. (Nevertheless, TOS 1.4 is a must for every
hard disk user because it speeds up everything quite a lot.)

We don't like these ideas very much here in Europe. First of all, why
should the US FCC restrictions be tighter than ours? Any facts about
this? Second, the US appears to us as a PC-sick country. Users don't
seem ready to change over to 68000 computers (except, of course, the
Mac). Third, after five years of software and hardware development
for the ST, the European market has proven to be more flexible and
powerful than the US market; European applications set the pace for
ST software development. Many good reasons for ATARI to favor Europe.

If you take out a single sided drive and put a double sided drive in
you should take the small adapter board away. I did with my 1040 drive
and it worked O.K. until I got my mega, and as far as I know it still
is.

Help!!!
Could someone post me uniterm 2.0e please!!!

How do you get Atari U.K. to give you tos 1.4 on roms, I already have it
on disk but it takes a while to load it in. As far as I can see it anly
speeds up the hard drive access (not counting the new dialog boxes).

Could you tell me please!!!

Pete.

>watch to hang beside the computer, and stopped using UHRLI. May just
>be coincidence, though.
>

I am afraid it probably was coincidence. I've just caught onto this
topic which is currently of great interest to me as last night I had
just this sort of problem while using TIMEWORKS.

As far as I am aware, these disks have never been anywhere near any other
software (except 1stWord) as I always switch off before using business
progs. I do not have a hard disk so I suspect the problem is not viral.
However, I am going to try to reproduce the problem and also check out
the floppies.

The symptoms I had were-
Selection of menu items required slight mouse movement after
the click to take effect.
Keyboard strokes also required slight mouse movement for the
character to be displayed.

Any tips/help etc would be appreciated, preferably by e-mail as I
cannot always guarantee to read the net within our 3 day expiry.
Equipment is 1040 STe.

John.

My Mega 2 does this too. Did it when it was new. Still does it now.
I take it to mean marginal power supply and heavy current draw by the
motor for the drive. So far, I have no hardware additions.

Anyone else who knows better have comments on this?

1749. Calamus PD Fonts

Newsgroup: comp.sys.atari.st
Date: 1990-02-15 15:05:30 UTC
From: arneso@IFI.UIO.NO
Message-ID: <9002151504.AAhelblinde01048@helblinde.uio.no>
Source record: 243377

I have just got hold of the following 24 CALAMUS PD Fonts

Apple, Artdecoy, Bullet15, Bullet25, Bully, Bullyc, Camelot, Celtic,
Classy, Cupertin, Dali, Hebrew, Manville, Math, Monroe, Oblique, Oldeng,
Oldirish, Pioneer, Pittsbrg, Silic, Steela_z, Stilleto and Wolftrap.

They are all rather dissapointing, though, with lots of missing letters,
digits and symbols. The intersting ones (in my humble opinion) are
Bullet15 & -25 with bullets, stars and the other famous symbols from
Timeworks DTP. The Math font contains a number of mathematical symbols.

I will send them in zoo-ed and uucoded form to anyone interested.
Just send me a note.

A little warning, though. The filesize is 166 kb (split in 3 parts to
avoid mail-server choking).

BTW If anyone has other PD Calamus Fonts - please send them to me :-)

> in the ways of the sysadmin, however! <grin>)

Others that I know about are:

* STadel BBS/UUCALL, by David Parsons. The BBS supports
Citadel networking plus external networkers; UUCALL is a
combination uucico/rmail/rnews for STadel. Shareware.

* UUMAIL, by Dale Schumacher. It's a combination uucico/rmail
that works with your favorite editor and file pager to serve
as a personal UUCP setup. Free. Note: This is no longer supported
(see below).

* UUPC, the limited UUCP system that is available on most
personal computers. It supports only one net connection.

* A BBS written by bill@meadow.UUCP that I haven't seen.

* UUCICO by Clemens Schrimpe. I have seen this, but not tried
it; the version I saw was quite limited.

* ST Mail. (I've saved the best for last.) Dale Schumacher, Tom
Cook, John Stanley and other STdNET folks have implemented Smail
2.5, Bill Wells' Lmail, a very nice 7-packet negotiated windowing
UUCP 'G' protocol, and a host of related utilities -- some ported
from Unix sources and some original work. This is the Whole Nine
Yards -- intelligent routing, piping of mail to programs (such
as an archive server, perhaps), intelligent mail routing including
full support of domain addresses, multiple mailboxes, mail
forwarding, automatic mailing lists, news and news forwarding,
... and Tom even has it working with STadel. This is in beta
testing, and it's working very well. Coming Real Soon Now*
to your favorite comp.binaries newsgroup, and free.

Feel free to add to the list.

--
* It would be coming more quickly if I were fixing PostNews and writing
docs instead of writing this.

It gives you a recoverable trashcan with Neodesk 2.05 and later. When you delete files, you can recover them later.

You install a new trashcan icon (included in the package) by dragging the trashcan.acc to the desktop (they recommend removing the old trashcan icon so you don't get confused), and whenever you delete a file, it puts it into a sort of limbo; a trashcan.dat (or some such) hidden file is written to that disk, and you can recover 'at any time' the file(s) in question. Works very similar to the Mac trashcan; note that when you "delete" the file it'll still take disk space. Also, if you run ICD's Cleanup or Tuneup or (I imagine) Hard Disk Sentry on a disk that has "deleted" files, it'll muff things up.

Mike

>
>that I'd ask....What's the current status on PCDITTO II? The last I heard it
>was halted from shipping because of a bug that make it fail on certain ST's.

As far as the bug is concerned, you heard correctly. Avante Garde recently (2-12-90) posted a message on Genie confirming a timing problem between the PCD II and the 68000 on the ST.

The proposed solution is to replace two PALS on the PCD II board (U27 and U15). These are socketed and shouldn't be a problem. They want those with problems to remove them, mail them to AG and *then* they will send replacement chips. I think they have it backward. They should send out the fix first. PALS are dirt cheap and readily available.

Since I don't have my PCD II yet, I'm hoping that it will arrive soon with the new PALS and will run fine.

If you want an exercise in frustration, try calling AG at (904) 221-2904 9:00 a, to 5:00 pm M-F. I did. It took me two days to get through.

Thos few who have a working PCD II say it's worth the wait. Let's hope so. SuperCharger is looking real good, but it's $399.

Shalom, lawrence

>Is there software available for these inexpensive machines to enable average
>people to do this? Has anyone seen examples of this kind of manipulation?

Well, we have a relatively expensive Pixar graphics machine
($40,000) that produces pictures so lifelike that it's uncanny. Note
that I said "produces", not "alters." These pictures are NOT photographs,
but are completely computer-generated.
So, not only can pictures be altered, but also they can be CREATED
FROM SCRATCH.

I own a Commodore Amiga, and indeed it is possible to retouch photos
on screen. Right now, the screen resolution of the Amiga (approx. 750 x 480
pixels in 4096 simultaneous colors) can display stunning pictures, but I
don't know how you would get an altered screen picture back onto a photograph.
You could photograph the screen, but that might result in a great loss of
quality compared to the original photo. Perhaps there is a better-quality
way to do this.

>We're talking about a tremendous potential for "disinformation"...

If you think about it, this isn't much different from the situation
that exists anyway. If you bring a piece of evidence into a courtroom, it
could be completely fake REGARDLESS of its medium. Documents can be forged,
alibis invented, fingerprints faked, guns substituted for other guns, etc.
In addition, it has long been possible to "stage" photographs.

So, I see the real problem is one of educating your jurors and other
judicial personnel in what fakery is possible. A photograph of my shooting
the president is not proof -- just evidence. And it is up to the judicial
system to accept or reject that evidence.

On the other hand, people tend to believe with their eyes more than
with any other of their senses. I could see that fake photographs could
sway a jury toward the wrong decision.

People have been saying for years that technology is racing ahead
faster than the software industry and the legal industry can handle it.
Well, it's true. But forewarned is forearmed.

Hi I read your message on the A16 list and was wondering if you could tell
me something about the Megafile 30...how fast is it, how reliable is it?
I am just about to buy one, but I haven't totally made up my mind. Do I need
anthing else to use it with?

Robert (S54394GR at ETSUACAD.BITNET)

There is an example of handling dialogs in Tim Oren's ProGem series. If you the form_do() in a loop awaiting the proper "exit" button, then wrap it in calls to form_draw() (is that the right call?), you shouldn't have a problem. As I recall, the form_draw() routine takes a numeric parameter which indicates its function. Zero allocates a screen area (whatever that means), one animates the zoom out, two animates the zoom in, and three releases the screen area, causing the redraw messages. Mr. Oren points out that calling form_draw() with a function code of three and the coordinates of the desktop will cause redraws to be sent for all windows; that is, there is no "balancing" required. I don't understand why you have to wait for the redraw to carry on. If your program handles messages as they arrive, this shouldn't be an issue.

I think those 3 MUSTs are both to the developer's and Atari's
advantage.

> The packet I received said a LOT about what the Developer
>must do, but very little about what the Developer receives for his $250.00.
>
>Basically, all the Developer gets for his $250.00 is some mailing lists from
>Atari Corp. And the option of having his products (demos thereof) being distributed
>by Atari Corp to all Atari dealers.
>

Having a mailing list of all Atari ST registered buyers and all
authorized Atari dealers can be a great thing to have for a developer.
And having a demo distributed to dealers sounds like good marketing to
me.

[more stuff deleted]
>And it doesn't even include the MWC C compiler. It contains the OLD OLD Alycon
>C compiler, which I have heard is VERY VERY bad.
>

Alycon C isn't VERY VERY bad. It's just not as good as MWC.

[more stuff deleted]
>don't want the Alycon compiler, and I don't like the $250.00 price tag. I do some part
>time C programming at home, and don't plan to market a commerical product. So, where
>does that leave me?? Out in the cold I believe.

>Diverse Data Products of Florida (800) 662-8662 is bringing out a $60 box in
>March that allows you to connect any IBM AT style keyboard you like to the
[..]

The German magazine mc did a replacement that was 100 % compatible,
way back (say -88 ..). The idea is to

-1 Take a very hard look at the ST circuit diagram,
note down the keyboard matrix, connections to
the IOContl etc.

-2 Build a new keyboard matrix with REAL keys, connect
to original keyboard controller etc.

There you are. It involves taking the thing completely apart, though.
You should be able to buy the circuit diagram (The local dealer
here carries it in his catalogue).

All the boxes that connect to the MIDI port are a loss, in my
opinion, for the reasons noted by Mark. Anyway, is there a way
to get the `both SHIFT keys are pressed' kind of data out from
a PC keyboard and into the ST MIDI/serial port ??????
(I once saw a program that needed this key-combination).

I will be adding a new keyboard to my ST (right after the
harddisk and the 2MB exta memory, sigh).

1760. ABC: New language sources and binaries posted

Newsgroup: comp.sys.atari.st
Date: 1990-02-15 17:30:16 UTC
From: steven@cwi.nl
Message-ID: <8809@boring.cwi.nl>
Source record: 243459
Cross-posted to: comp.lang.misc,comp.sys.atari.st,comp.sys.ibm.pc,comp.sys.mac

The source and binaries of a new programming language, ABC, are being posted this week to comp.sources.unix and comp.binaries.{ibm.pc, atari.st; mac}. This posting gives an overview of the language and some examples.

THE LANGUAGE
ABC is an imperative language originally designed as a replacement for BASIC: interactive, very easy to learn, but structured, high-level, and easy to use. ABC has been designed iteratively, and the present version is the 4th iteration. The previous versions were called B (not to be confused with the predecessor of C).

It is suitable for general everyday programming, the sort of programming that you would use BASIC, Pascal, or AWK for. It is not a systems-programming language. It is an excellent teaching language, and because it is interactive, excellent for prototyping. It is much faster than 'bc' for doing quick calculations.

ABC programs are typically very compact, around a quarter to a fifth the size of the equivalent Pascal or C program. However, this is not at the cost of readability, on the contrary in fact (see the examples below).

ABC is simple to learn due to the small number of types in the language (five). If you already know Pascal or something similar you can learn the whole language in an hour or so. It is easy to use because the data-types are very high-level.

The five types are:
numbers: unbounded length, with exact arithmetic the rule
texts (strings): also unbounded length
compounds: records without field names
lists: sorted collections of any one type of items (bags or multi-sets)
tables: generalised arrays with any one type of keys, any one type of items (finite mappings).

THE ENVIRONMENT
The implementation includes a programming environment that makes producing programs very much easier, since it knows a lot about the language, and can therefore do much of the work for you. For instance, if you type a W, the system suggests a command completion for you:
W?RITE ?

If that is what you want, you press [tab], and carry on typing the expression; if you wanted WHILE, you type an H, and the system changes

the suggestion to match:
WH?ILE ?:

This mechanism works for commands you define yourself too. Similarly, if you type an open bracket or quote, you get the closing bracket or quote for free. You can ignore the suggestions if you want, and just type the commands full out.

There is support for workspaces for developing different programs. Within each workspace variables are persistent, so that if you stop using ABC and come back later, your variables are still there as you left them. This obviates the need for file-handling facilities: there is no conceptual difference between a variable and a file in ABC.

The language is strongly-typed, but without declarations. Types are determined from context.

IMPLEMENTATIONS
The sources for the Unix version are being posted to comp.sources.unix; the binaries to comp.binaries.{mac, ibm.pc, atari.st}. They should also be available from some servers (for instance by anonymous ftp from hp4nl.nluug.nl and mcsun.eu.net, or send the mail message
request: index
topic: index
to info-server@hp4nl.nluug.nl, for information on how to get it by mail).

There is an irregular newsletter available from us, and a book "The ABC Programmer's Handbook" by L. Geurts, L. Meertens and S. Pemberton, will be published by Prentice-Hall shortly (ISBN 0-13-000027-2).

See also Steven Pemberton, An Alternative Simple Language and Environment for PCs, IEEE Software, Vol. 4, No. 1, January 1987, pp. 56-64.

```

```
TEXTS
>>> PUT ("ha " ^^ 3) ^ ("ho " ^^ 3) IN laugh
>>> WRITE laugh
ha ha ha ho ho ho
```

```
>>> WRITE #laugh
18
```

```
>>> PUT "Hello! "^^1000 IN greeting
>>> WRITE #greeting
7000
```

```
LISTS
>>> WRITE {1..10}
{1; 2; 3; 4; 5; 6; 7; 8; 9; 10}
>>> PUT {1..10} IN l
>>> REMOVE 5 FROM l
>>> INSERT pi IN l
>>> WRITE l
{1; 2; 3; 3.141592653589793; 4; 6; 7; 8; 9; 10}
```

```
>>> PUT {} IN ll
>>> FOR i IN {1..3}:
INSERT {1..i} IN ll
>>> WRITE ll
{{1}; {1; 2}; {1; 2; 3}}
>>> FOR l IN ll:
WRITE l /
{1}
{1; 2}
{1; 2; 3}
>>> WRITE #ll
3
```

```
COMPOUNDS
>>> PUT ("Square root of 2", root 2) IN c
>>> WRITE c
("Square root of 2", 1.414213562373095)
>>> PUT c IN name, value
>>> WRITE name
```

```
Square root of 2
>>> WRITE value
1.414213562373095

A TELEPHONE LIST
This uses the table data-type. In use, tables resemble arrays:

>>> PUT {} IN tel
>>> PUT 4054 IN tel["Jennifer"]
>>> PUT 4098 IN tel["Timo"]
>>> PUT 4134 IN tel["Guido"]

>>> WRITE tel["Jennifer"]
4054

You can write all ABC values out. Tables are kept sorted on the keys:
>>> WRITE tel
{["Guido"]: 4134; ["Jennifer"]: 4054; ["Timo"]: 4098}

The keys function returns a list:
>>> WRITE keys tel
{"Guido"; "Jennifer"; "Timo"}

>>> FOR name IN keys tel:
WRITE name, ":", tel[name] /
Guido: 4134
Jennifer: 4054
Timo: 4098

You can define your own commands:

HOW TO DISPLAY t:
FOR name IN keys tel:
WRITE name<<10, tel[name] /

>>> DISPLAY tel
Guido 4134
Jennifer 4054
Timo 4098

To find the user of a given number, you can use a quantifier:
>>> IF SOME name IN keys tel HAS tel[name] = 4054:
WRITE name
Jennifer

Or create the inverse table:
>>> PUT {} IN subscriber
>>> FOR name IN keys tel:
PUT name IN subscriber[tel[name]]

>>> WRITE subscriber[4054]
Jennifer
```

```
>>> WRITE subscriber
{[4054]: "Jennifer"; [4098]: "Timo"; [4134]: "Guido"}

Commands and functions are polymorphic:
>>> DISPLAY subscriber
4054 Jennifer
4098 Timo
4134 Guido

Functions may return any type. Note that indentation is significant -
there are no BEGIN-END's or { }'s:

HOW TO RETURN inverse t:
PUT {} IN inv
FOR k IN keys t:
PUT k IN inv[t[k]]
RETURN inv

>>> WRITE inverse tel
{[4054]: "Jennifer"; [4098]: "Timo"; [4134]: "Guido"}

>>> DISPLAY inverse inverse tel
Guido 4134
Jennifer 4054
Timo 4098

A CROSS-REFERENCE INDEXER

'Text files' are represented as tables of numbers to strings:

>>> DISPLAY poem
1 I've never seen a purple cow
2 I hope I never see one
3 But I can tell you anyhow
4 I'd rather see than be one

The following function takes such a document, and returns the
cross-reference index of the document: a table from words to lists of
line-numbers:

HOW TO RETURN index doc:
PUT {} IN where
FOR line.no IN keys doc:
TREAT LINE
RETURN where
TREAT LINE:
FOR word IN split doc[line.no]:
IF word not.in keys where:
PUT {} IN where[word]
INSERT line.no IN where[word]

TREAT LINE here is a refinement, directly supporting
stepwise-refinement. 'split' is a function that splits a string into
its space-separated words:
```

```
>>> WRITE split "Hello world"
{[1]: "Hello"; [2]: "world"}

>>> DISPLAY index poem
But {3}
I {2; 2; 3}
I'd {4}
I've {1}
a {1}
anyhow {3}
be {4}
can {3}
cow {1}
hope {2}
never {1; 2}
one {2; 4}
purple {1}
rather {4}
see {2; 4}
seen {1}
tell {3}
than {4}
you {3}
```

>something.

This is a good way to get yourself prosecuted. A better way would be to get the names of the people doing the pirating, the software packages they are copying, and turn them into the manufacturers. The FBI might not do anything, but you can bet some of the manufacturers of the software do. I remember something in my Fontz! manual where the author encouraged legit users to turn in illegit users of NeoCept's software to him personally. He stopped short of promising physical retribution, but gave the feeling that he would see to it personally that something would be done.

Most developers of ST software (save for WP Corp. and some others) are not multi-million dollar enterprises, they are people like Dave Beckenmeyer, Dave Small and Derek Mihocha (sp?) who would like to derive a livelyhood from their work. You can bet your a*s they are interested in seeing pirating stopped.

Sure, so those worms, viruses, etc. will just be passed out into the rest of the world, where innocent people will get blasted. Great idea. The magnet thing has possibilities, though. :-)

1763. WordPerfect Educational Discount

Newsgroup: comp.sys.atari.st
Date: 1990-02-15 19:18:23 UTC
From: jburka@pewter.ucs.indiana.edu
Message-ID: <35964@iuvax.cs.indiana.edu>
Source record: 243464

Yes, WordPerfect does have an 'education discount' on ST WordPerfect...

It costs $99, and is identical to the normal commercial version in all ways except the color of the binder (and, in fact, I bought my educational package just as WP was hitting the shelves 2+ years ago, and have the standard binder!)

You can order directly from WordPerfect (you'll need an order form, available from WP or from some computer stores) and you need to be able to show a valid school ID.

WP's address is:
288 West Center Street
Orem, Utah 84057

The phone number for the atari support divison is 1-800-321-3271.

The order form for the educational version is fairly generic (it lists all platforms; you check off the one you want) and should be available at just about any computer store. I got my order form from an Amiga dealer. When I was looking for another order form several months later, I ran into trouble. I went into one IBM-based computer chain (Entre, in the DC area) and was told that WP didn't have a discount program (HAH!). The next store I tried told me that they could sell me the educational version, but they refused to give me an order form! (This was an ST store, and I needed the IBM version of the program). Finally, another ST store gave me an order form.

Good luck

Jeff

I had similar problems with any program compiled with pascal (like ff.ttp).
They all got an address error when starstrk.acc was running. All this was
observed while working in a non-GEM shell.
This program looked so nice! :-(:-(

Someone asked about the grease under the keys?

Someone correct me if I am wrong, but:
The stuff is lubricant put on the wire handle looking things so that the keys don't hang or have friction when you strike them. Only the larger keys have this (Return, Shift, Alt, Etc)

Lets try to catch and fix this.

Does anyone having the problem also have a memory switcher?
If so, when the problem hits, if you can talk to the switcher, SAVE the
memory image. Perhaps we can pass the image around and many more people can
look at the problem, and if its constant with the image, maybe even
get Atari interested.

Message-ID: <1205@elmgate.UUCP>
Source record: 243404

Well, a few reponses are in. And, A few of my Own experiments.
I have tried the VDI raster form functions. And, the results were
poor (specially movin' the entire screen (over itself if you will, boy,
is it POKEY!). So, I decided to go straight to the BLIT Line-a function.
After some finaglin' I got it working, It too is unacceptable, and the
screen gets all funky unless one VSyncs(). So, I decided, to see what'd
happen if I just Blit one plane (What we are doing here, BTW, is taking
3 logical displays (making up a "playfield") if you will, in low-res,
that are to be horizontally scrolled either left or right, smoothly, and
at a decent rate of speed) and It too was unacceptable. All of "my"
tests of the scrolling have been all "on screen", which, If a blit has
any brains about should "make a difference" (as in my tests, the source
& dest rects overlap). And it's a REAL sad performer, matter o' fact,
I'd bet bottom dollar that it could be DRASTICALLY speeded up. This
eve I will try from my actual playfield. One reply I recieved (of all 2
so far) stated troubles with sprites. Using the BLIT I'd see no real
problems. The obvious way to implement color sprites (an virtually any
size (though collisions can be another matter)) is to take your image,
Shift it all the way left in your buffer (so your "lead pixel") aligns
on a word boundary (or long word) and start shiftin the image through
each and every permutation of the 16/32 bits, then all one need do
is bleam the proper permutation onto/into your screen/buffer et el.
All one need do is find the pixel index into the word/longword where
ones coordinates lay, use it as an index to your sprite permutations.
Zippity aye' it works too, I've done it. It's quite simple actually,
just a little memory hungry and that can be finagled if one wishes
to do an on the fly RLE or some such item. I have never pushed it
(never had the need) over the amount of 16 32 bit sprites, but, the
performance is more than adequete.

I don't think you'll be able to coerce the disk controller to give you
the data at 230 instead of 250kbits/sec. Sounds a lot like Apple/Localtalk
to me, why don't ya wait for Dave Small to finish his board...

Why doesn;t he try getting a software blitter like Turbo ST? That might help a
lot of the speed problem, then he could leave the board hooked up all of the
time...

When I first got my hard drive, I found a pd defragger on a local BBS. I read the doc file and it suggested BACKUPS and more BACKUPS before running a program which is supposed to check the structure of the disk and possibly fix it before doing any defragging. I backed up all 3 partitions, and ran the checker, and it said my hard drive had link problems or some such. Well, I ran the defragger anyway and it trashed my partition. I restored the partition, and the next day I want to MicroTyme and bought Hard Drive Trubo Kit from Michtron. It also had a chkdsk, but aside from some blocks that were marked as bad when the drive was originally formatted, it found no errors. The manual tat came with it assured me that the program had been written so that in the worst case, I would lose very little data if something went wrong. I still had my back-ups, so I defragged my partitions. 30 meg in less than 15 minutes, it was awesome! I run the check portion and the defrag portion about every other week. I've been doing this for about 6 months without a SINGLE problem. Twice I have had the checkdisk report a disk error, and both times it fixed them without any data loss.

The moral is, PD defraggers are risky (IMHO). I know my exerience with this is limited to only two packages, but I can't say enough good things about how the product I purchased works. And I pulled the PD defragger to my trashcan 6 months ago and haven't missed it. HDTK was money well spent!

BTW, it also backs up your hard drive in one of three ways, and it comes with a disk cache too. (I don't use the cache much, because I only have 1 meg and can't afford to allocate enough memory to make the cache worthwhile...)

Out of curiosity, wouldn't it be simpler just to set all the colors to zero? Sure, you'd need a whole 32 bytes to store the original colors in, but I'm sure you could find that much somewhere. It seems to me that just reversing the screen video would keep a particular PATTERN from burning in, but wouldn't stop contribution to overall monitor dimming. By the same token, switching to a blank area won't help if you're background color is white (or bright color) for the same reason.
I haven't found any screen saver that I've liked yet. The Fuji one sounds interesting but sort of defeats the whole purpose of a screen saver (ie prevent a pattern from burning into the monitor, and prevent the monitor from losing brightness). I have a PD one which kicks into effect after no input for so long, but it tends to cause programs to crash (or stop, more often, including file transfer programs!)
If anyone would be willing to send me the basic code for one (I don't have the time these days to write daemons), and your list of complaints about existing ones, I'd try my hand at writing one, but no doubt it'd be bug-filled as well.
Mind you, I'm not knocking anyone's code; I'm just mentioning my own views about this subject. As for killing the V-sync, I've got a NEC MultiSync 3D, and if the Vsync drops, the monitor screeches like it's being tortured!

Source record: 243406

I'm the person who adapted a DEC keyboard to the ST. I did it because
I wanted a better keyboard that retained the DEC layout. I also do
stuff with PC's and I seriously considered using an extended PC keyboard.

There would not be a problem with shift keys or the alt key or whatever.
The ST, in many ways, copies the PC. The keyboard is one of those ways!
PC keyboards and Atari keyboards send similar scan codes. They send those
codes whenever a key is pressed and whenever it is released. No problems
there. The problem is in the interface between the keyboard and the PC.
It requires extra circuitry to interface, while the DEC keyboard does
not. On the other hand, the DEC keyboard doesn't distinguish between
the two shift keys. Big deal.

Neotrash is a recoverable trashcan accessory. It replaces the trashcan on Neodesk 2.05 or higher versions only. It was distributed by Gribnif as "freeware" as a 'gift' to it's users. At first I thought, "Great! now it will be just like the black hole on the NeXT!" But upon reading the documentation, I found out that it IS like the black hole on the NeXT. What that means is that you have to go through two steps to delete something. When you drag an item to the trashcan, it removes the entry from the directory, and stores it in a hidden file on the root of the disk that the file was deleted from. It keeps the bytes on the disk that are used by the file marked as used so they don't get overwritten. Then if you want to recover a file you just double click on the trashcan and select it and click on recover.

There are three drawbacks to this:

1) Your trashcan fills up real quick, and the new trashcan isn't a real replacement for the old trashcan. (If you drag an icon from the desktop to the trashcan, it will try to actually delete that item. Bit it IS recoverable).

2) Since the clusters are marked as used, but are not assigned to a file, programs that check the structure of the disks will report errors, and optimizers will TRASH the disk.

3) The files still take up valuable space on your hard drive.

Still, it IS freeware, and some of you may be interested in using it, so I will be posting it tonight to comp.binaries.atari.st. (If I get time...)

I just wonder why they didn't make it easier and just hide the files that have been deleted....

While we're talking about mice, I just purchased Practical Solutions' cordelss mouse! It works VERY well. Has an incredible feel and response. It's SO nice not to have the cord getting tangled up all of the time. I've had it for exactly one week, and after reading about all these mice problems and different rollers and such, I opened the door to my roller, and it has metal rollers, that are already showing a little bit of build-up. I have a mouse mat, but I think that may be part of the problem. Seems like mats would just trap dirt and let them get inside. My mat has a sort of cloth covering, but I've seen mats that are hard and feel almost like plastic. Has anybody used a mat like this, and did your mouse get all dirty inside?

>get a CRC error.

Sure, many. Never had a problem. There are two ways to do it.
One is to make sure that your file transfer protocol handles
full 8 bit bytes. Many are oriented to handling only graphic
characters (94 or 95 or so). The other, which I use, is to
"uuencode" the file first, then "uudecode" it at the other end.
This is the choice I use. I have zoo on the Atari ST and the
PC and UNIX system at the office.

The uu-encoder and decoders that I like best are UUE and UUD by
J-J.Dumas. His code is highly reliable and overcomes some of
the difficulties of certain notorious gateways between BiTNET,
and UseNet and InterNet.

The problem is the "if" in the last sentence. Some badly programmed applications do not send their output to some window but simply put it on the screen. They will not look for WM_REDRAW messages and thus will not process any of them. (I am not quite sure whether a form_dial (3, ...) causes the screen manager to send a WM_REDRAW to the window with handle 0 (the screen) but if the application does not care for WM_REDRAW messages that would not make any difference.)

Hi folks,
I apologize if I'm beating a dead horse, but I'm new to ST's -
ich bin neu hier. I'll keep this short.

I understand that ST monitors come in two flavors - color and monochrome. Monochrome has high resolution (good text, but can't run anything written for the color monitor), and that color has medium (?) resolution (garbage text - no offense intended. Has impressive color graphics). I'd REALLY hate to have two monitors sitting on my desk. In other words, I want a monitor that can handle BOTH color and monochrome capabilities with a switch to select one of the modes. On an unrelated note, if the monitor can also accept TV/VCR signals, that would be nice too :-). I heard that someone on this newsgroup is very happy with a Magnavox monitor; what's the model? Any other suggestions are appreciated.

/Taka Sajima
sajima@watsun.cc.columbia.edu

P.S. I'd also welcome any interesting tidbits, tips, horror stories, work-arounds, etc. Thanks.

1788. Usage of GNU GDB on Atari ST

Newsgroup: comp.sys.atari.st
Date: 1990-02-16 09:06:35 UTC
From: fgth@ugun13.UUCP
Message-ID: <137@ugun13.UUCP>
Source record: 243457

Hi folks.

I'm trying to use the GNU source level debugger, which comes
with the GCC-136 binary distribution. Please enlighten me, how
to use the debugger. I have the original GDB manual 3.1 available.
Here is the way I tried to use GDB.

- compiling with the -gg option
- linking with sym-ld (the library gnugdb is missing, therefore
I used the normal gnu.olb)
- running gdb
load the just compiled executable with "exec-file"

After I've load the executable, I can list the source code, but I
can't set a breakpoint. The command "break 48" is answered with
an error message meaning "There is no line 48 in the source file".
The command "info function" didn't give me any output at all.

Should I replace the gcc-ld.ttp with the sym-ld.ttp ??

I guess, it would be a good idea to compile a manual specific for
the Atari ST from the existing GNU manuals and also include
the libray functions ala U**X style. I might be willing to do that,
if I can enough input from the people, who did the fabulous work of
porting the gcc to the Atari, concering Atari specific points. I
have the texinfo manuals for the compiler (from GCC 1.33), the
preprocessor and the debugger (version 3.1) available. The resuling
manual should be more of a reference manual, than a user guide.

1789. Re: Piggybacking RAM into the 1040ST

Newsgroup: comp.sys.atari.st
Date: 1990-02-16 09:16:52 UTC
From: pfg@ukc.ac.uk
Message-ID: <3864@harrier.ukc.ac.uk>
Source record: 243401

You should not realy 'PIGGY BACK' RAM chips on a 1040 as the process was
designed to upgrade a 520st to a 1040. (I was taught how to do this upgrade
by a technician and you need a very small tipped iron to do it)

To do it on a 1040 you need to do a bit more than just take one line
to the MMU. As you already have the two banks of RAM the line has already
been used. To upgrade a 1040 to 2.5 (or even 4mb) was someting I looked into
for a very long time, as I was continualy running out of RAM in my 1040.
However Uncle Jack made the MEGA 4 so I got one.

The internal structure (I.E. MMU and GLUE) of the MEGA is the same as the 1040
so you can access up to 4mb of RAM in any ST (up until the STE which can access
8mb). Some say you can upgrade to 16mb but Where would you fit the RAM in the
memory map???. If you could the the case would lie that you can upgrade a 520
to a 16mb machine.

Anyway back to the question......

To upgrade a 1040 is NOT as easy as upgrading a 520. First (You don't have
to do this it's just safer, and it gives you 16 4256's to upgrade you friends
520st) you must remove a whole bank (YES ALL 16) of your RAM chips. This is
not a task to be taken lightly as the quality of all circuit boards are very
low so you could break you board without meaning to. Then you must get the
pinouts of the 1 megabit chips that you are going to use. These cost an
awfull lot of money over here in England. After this you MUST (or at least
you may find it easier to fix if it dies, if you do) is put in DIL sockets
in the place of the 4256's. Then comes the fun bit with loads of beding
up pins and wiring them to different places using wire-wrap wire (The pins
that you will need to connect to are mentioned below). Then comes testing
If you've done it right you will have 2.5mb of RAM. If you've done it wrong
OOPPSS and see if you have connected them to the right pins (I.E. DATA) and cut
the three tracks that come from the pins you use on the MMU. There was a
letter going round on how to do this which was quite good and if anyone has it
could they repost it!!!

CONNECTIONS:

MMU PIN 63 MAD8 : memory address data pin 8 (This gives a memory size of 1mb/b)
MMU PIN 64 MAD9 : memory address data pin 9 (This gives a memory size of 2mb/b)
Then you must connect your row and column address stobe lines up, these will
vary depeding on which bank you change. There are 2 column lines and 1 row
line.
The pins that you need to connect up on the RAM chips should be ducumented
where you buy them.

No one to my knoledge has ever tried putting 1mb on one bank before so I think it can not be done.

GOOD LUCK.

Pete.

I found the much talked about Key virus on my legally purchased PC-DITTO disk (Euro version 3.96). Luckily I check every new non-empty disk using George Woodside's VIRUSKILLER. Also, I found the so-called Mouse virus on my legally purchased TURBO-ST 1.6 disk. Of course I've informed my dealer right away, guess what: the copies in stock had the virus too. Who said virusses won't harm you if you only BUY software?

>developers there.

"We" means: There are some German ST users who delved into GEMDOS and BIOS very very deeply. Among them are Alex Esser, the author of a series of articles on GEMDOS in the German magazine "ST-Computer" (can be reached via FIDO), and Andreas Kraemer, author of a book called "TOS intern". In this book you'll find a completely recompiled listing of GEMDOS (taken from TOS 1.2). The book has quite a few bugs, but it serves well to gain some general insight in the workings and in the failings of GEMDOS. It is available from Heise Verlag, Hannover. (If you are interested, I can find out the complete address.) I know that some other German hackers have extracted parts of GEMDOS, some others have done the same for VDI and AES but this work is not completed yet. BIOS source code is available since 1985 as commented disassembler listings in severals books here in Germany.

ATARI Germany definitely doesn't distribute any GEMDOS source code.

Has anybody tried to push some of the SHIFT/CTRL/ALT keys when the
phantom typist shows up? Somebody wrote somewhere that this might
prevent the application from crashing so that you can save your
work before system breakdown.

Date: 1990-02-16 10:38:07 UTC
From: erwinh@solist.htsa.aha.nl
Message-ID: <1505@maestro.htsa.aha.nl>
Source record: 243405

Can someone please explain how they come to the story that the market in the States is so much bigger than the market in Europe ??
As for what I have read, the market potential of the States for Atari isn't verylarge, as there are millions of console sold in the States.
As for Europe the number of consoles is much smaller, thus having a larger potential for Personal Computers (I don't mean the PC here, as this computer has sold ten times more in the States than in Europe)

I may have a wrong point here, but still this how I feel about this issue.

From: msb88@ecs.soton.ac.uk
Message-ID: <603@ecs.soton.ac.uk>
Source record: 243472

ARGHHHHHHHHHHHHHHHHHHHHHHHHHH!
I feel better now, sorry about the fouling of the brain waves!
Is there anyone out there who knows of any ftp sites in the US or elsewhere where one can obtain atari demo's software, utilities, games e.t.c and the required logon procedures. I would be very happy to receive any feedback at all(hopefully not all negative!). Please leave a message or if you feel brave enough try mailing me directly.

I have one of the 'newish' atari ST FM's not one of the new E's. By the way how good is the E?. I have heard rumours that it doesn't load all the st software e.g ikari,certain spreadsheets and is not entirely compatible with the old St's. It is also not very good with the Pc emulator Ditto. Has anyone out there got any expertise on the matter??

Having one of the newish ST's means that i have surface mounted chips and i am having difficulty upgrading to one meg without spending a lot of money as a special machine is required to change the chips. Does anyone know of any addresses of reliable, cheap (does it exist?) firms, in the UK if possible, that will do upgrades? Have any whizzes out there overcome such difficulties?

Thanks alot for reading this message
All replies gratefully received.

I have experienced the Phantom Typist a couple of times lately, only since I bought a hard disk though (a Third Coast Technologies 45MB SCSI which I would reccomend to anyone). The software I use is all my own and all the keyboard interactions are via evnt_multi. No fancy keyboard tricks! Could the use of fast DMA be affecting anything?

>way to test for that? I'd like to determine where I picked it up from.

I know of no programs which spawn the "KEY", or any other virus (on the ST)
as of this date. The only way to get infected is to boot your system from
an infected disk.

As for testing for a "spawn" program, I'm about to submit the new VKILLER
to the binaries group. It will provide a means of installing a tiny
monitoring program which will check all passing floppies for executable
boot sectors. If you run a program which installs a virus on a disk,
the next access to that disk will cause an alarm to be triggered.

The new version has been beaten to death by some of my long suffering
friends (to whom I express my gratitude for their patience and efforts)
and is heading for the net, Compuserve, and GEnie this weekend (Feb 17).

It still does not deal with hard disks, because I have no concrete
information about any virus which is hard disk specific. It does not
deal with link viruses, for the same reason.

I have developed some new software to deal with link viruses, or
program alteration in general, but it is a bit too large to install
into the working version of VKILLER. I'll be submitting a separate
program to deal with those, in the near future. Please be patient.

1803. Interrupt help, please.

Newsgroup: comp.sys.atari.st
Date: 1990-02-16 13:00:58 UTC
From: chrisl@fulcrum.bt.co.uk
Message-ID: <+!!#!%_@masalla.fulcrum.bt.co.uk>
Source record: 243409

I'm trying to get interrupt-driven I/O working over the serial port
on my 1040 ST. I've installed the address of my interrupt service routine in
the appropriate vector (transmit buffer empty on the MFP -- it's 69, I think),
and then stuffed a character into the MFP data buffer. The service routine
gets called OK, but the program then hangs, killing the machine.

Actually, I've tried several things. When I started, I just put the
address of a C routine in the vector, and it crashed with a bus error, I
think. I presumed this would be because the C function does an `rts', not an
`rte' at the end of the routine, so it was pulling the wrong stuff off the
stack. Then I wrote a little routine in assembler which calls my C routine
and then does an `rte'. This is the version which hangs the machine.

I have put some flags in, and the C routine gets called OK, and
returns to the assembler routine OK, but then it all goes very quiet. Even
the keyclick goes away.

Has anyone got experience of installing new interrupt service
routines on STs? Am I doing something really naive? Help!

Advance thanks in desperation,

- Chrisl.

1805. GEMDOS / MSDOS Disk Corruption

Newsgroup: comp.sys.atari.st
Date: 1990-02-16 13:26:01 UTC
From: woodside@ttidca.TTI.COM
Message-ID: <10001@ttidca.TTI.COM>
Source record: 243429

I've stumbled onto one sure fire way to do this, and thought that I may not be the only victim. Actually, this doesn't require an MS-DOS system, just any other computer with a compatible disk structure (including another ST).

Read or write anything on a disk in an ST. Remove the disk, and put in the other system. Alter its contents. Put it back in the same drive in the ST (assuming you have not accessed another disk in the same ddrive). Write something on it. Poof. Disk corrupted.

Why? Simplicity. I would have kicked myself if I had the agility required for such acrobatics.

The ST identifies disks via the serial number. When a disk is removed, or inserted, the ST hardware recognizes that the media "may have changed". GEMDOS then checks the serial number before accessing the disk again. If the serial number has not changed, GEMDOS diagnoses the situation as "same disk", and deems the current buffers to still be valid. These buffers most likely contain portions of the directory and FAT. When you write to the disk again, the buffered directory and FAT are used, rather than re-read them from the disk.

If you are running from the desktop, you can cure this situation with an ESCAPE in TOS 1.4, since that forces a disk re-read. In older TOS versions, or most shells, you have to access a different disk, then re-insert the one you want. Note that if both disks have the same serial numbers (like all disks formatted on MS-DOS machines do), you are really out of luck. You'll probably trash both of them.

Is this a bug in GEMDOS? No. The operating system is behaving exactly according to the specifications. This is a more insidious problem: the dreaded Operator Error!

Signed,

STUPID in Santa Monica.

1806. Wordperfect and Starstrk

Newsgroup: comp.sys.atari.st
Date: 1990-02-16 14:10:37 UTC
From: depeche@quiche.cs.mcgill.ca
Message-ID: <2212@calvin.cs.mcgill.ca>
Source record: 243478

I found that if Starstrk is installed while WordPerfect 4.1 (aug 89)
is running, the F5-List Files command doesn't display files - only
folders.

There may be other side effects of using starstrk, but since PYRO
doesn't work on my computer (anyone know why? Does it work under tos 1.4?)
I am still using it, and I just don't use the f5 command. At least I know
that if I want it again, all I gotta do is get rid of starstrk.

1807. Re: Fine scrollin'

Newsgroup: comp.sys.atari.st
Date: 1990-02-16 14:23:57 UTC
From: stefan@spcc386.UUCP
Message-ID: <590@spcc386.UUCP>
Source record: 243412

Horizontal fine scrolling on the ST is not very easy. I have some experience with demo/game programming on the ST and I'll tell you, nobody likes to do it because it guzzles processor time.
Forget the blitter, you might be able to scroll 30-40% of the screen with it, and lose all processor time.
Since the screen of the ST is just a dumb memory map, pixel-scrolling can only be done by actually shifting the screen image. A long list of LSR of LSL instructions will do this for you, but no way you can make this work properly, because you simply haven't enough time. You might be able to do it in 4-5 vbls, but then it looks awful. Add to this that the low-res screen is divided into four planes and the horror is complete.
Now clever tricks will help you a bit, but scrolling the whole screen still is very hard to do. Storing your images pre-shifted and blitting the right frame is one trick, but this uses lots of memory (imagine storing everything shifted 16 times) Using screen buffers and clever code is also possible.
One last alternative is 'Sync scrolling'. This is a incredibly difficult trick that uses a glitch in the Shifter/MMU to open screen borders. Mess around properly with them and screen borders will be opened ('Overscan'), mess around even more and the physbase will start moving around, scrolling the screen, but this is only for the superfreaks amongst us.

Happy hacking!

> Of course maybe I'm stupid and there's a valid reason
> for it.
>
>
> -Greg

My guess is that this mostly happens because people send a message direct to a mailing list rather than to the administrator of the list. Not everyone, especially people who are new to networking, knows the sometimes subtle differences in the addresses.

I think we should all show a little patience with such messages. I remember how confused I was when first introduced to Usenet, and I would not have appreciated lots of messages telling me to piss off after making an obviously unintentional error. If you mail the authors, try to be helpful. We can all use a little help now and then.

Anyway, these messages are all very short. They don't cost much time or money to read.

Graham

Source record: 243480

My two cents on the behavior of the 'constant' -32768 in C. If something is #define ed as -32768, remember that that means a _textual_ substitution will be made wherever that thing appears (in contrast to a numeric substitution). So the normal rules for integer constants apply (rather than some special rule that might apply to preprocessor actions: the preprocessor action is simple). Integer constants don't have leading signs. -32768 gives the result of applying unary minus to the integer constant 32768. And on a 16 bit model compiler, there isn't an integer 32768. So the value of -32768 is free to vary depending on context. One hopes a warning message is generated (it is in Mark Williams C). Frankly, -32768 is such a convenient value for flags on a 2-s complement machine, that I'd like integer constants to have an optional leading sign, but it isn't defined that way.

I just got around to unpacking rsplot11 which recently came by. Several different unarchivers report damage to rsplot.prg in the archive, and it doesn't load, but it contains readable strings and the next file in the archive is ok. This behavior is so unusual for the results of transmission errors that I thought I should ask if anyone has run it from the distribution before getting a new copy.

The issue of having to move the mouse slightly when selecting menu items reminds me of a similar problem on my machine. I have had instances when a double click on a program doesn't do anything until the mouse moves. It was suggested to me that the button up packet from the Ikbd was being lost somehow, and the GEM didn't realise that the button was indeed up until the next packet, which was a mouse move, had the button flag cleared. I get this happening in the desktop as well as in programs.

Having played around with writing a program which waits for all sorts of things, I have discovered that it is not difficult at all to loose input. You also have to be very careful about how the keyboard interrupts are handled so that you don't overrun the internal queues when someone types quickly. Part of the solution is realising that you are single threading all of those inputs through evnt_multi() in a loop. Plenty of opportunity for deadly embrace or message explosion resulting in a crash.

>
>To transfer money to me you should take the information above,
>walk to your bank and ask the clerk how to do it. They are the
>experts, they really should know. I would like to hear
>how/whether you succeeded!

I run into this problem frequently, since I go to a lot of foreign conferences and they often specify that the registration fees are to be transferred to a Postgiro account. If you are transferring several thousand dollars this is great, but it is not the way N. Americans transfer funds, so if you go to any bank I have tried you will find that the handling fee is much larger than the usual shareware payment.

Basically we use cheques and money orders, sent by mail. This seems to be the cheapest method by far. If anyone else has info on sending money to foreign countries (outside Canada and the US that is), please post it.

> - he seems friendly enough to talk to.

I agree with Peter, and wish that I could have expressed what I heard from Charles Cherry as well as Peter did! :-)

But, for you who want to become a registered developer, you have an excellent opportunity to get published in a new mag called ST JOURNAL. I called Neocept to ask about WORD UP 3.0 (which I wanted to upgrade to from WordUp 2.), and the Technical Support guy at Neocept (sorry I didn't write down his name :-( ), gave me the phone number to ST JOURNAL. I lef the number at home but will post it later today.

Anyway, ST JOURNAL will publish its preimer issue in march with a cover date of April. And the best news is that ST JOURNAL is looking for articles. I suggested a couple of ideas that I am working on, and so I want to try to get published in ST JOURNAL myself. So, that would qualify me as a Developer according to Peter's above comments.

I will post a complete message about ST JOURNAL soon.

P.S. After discussing the situation with others on GEnie, I have come to the conclusion that the $250.00 price is a fair price for the ST Devloper package. I have talked to other developers who couldn't say much, but they all did agree that it was worth the money. So, after I get published, or finish a couple more ShareWare programs, I am going to submit for a Dev. kit.

P.P.S. Anyone interested in some ShareWare PageStream templates for various AVERY Laser Printer Labels?? I am developing some PgS templates for the entire line of AVERY Laser Printer labels, as well as some utilities to gather data to be imported into the labels. For example, I am writing some code to convert the various disk cataloging datafiles into ASCII files to be imported into 3.5" and 5.25" AVERY LASER LABELs. Just a few things that I am working on.

1818. Re: Fine scrollin'

Newsgroup: comp.sys.atari.st
Date: 1990-02-16 16:33:46 UTC
From: soohoo@cory.Berkeley.EDU
Message-ID: <22178@pasteur.Berkeley.EDU>
Source record: 243420

[Article related the woes of attempting to fine scroll using a full screen blit, through both VDI and LineA]

Jeff,
First of all, if you want to see fine scrolling of the entire screen done smoothly and well, take a look at NEOSHOW...

I've been toying with writing games and other such nonsense on the ST for quite some time, and the ways to fine scroll are various and sundry, but they amount to this:
1) You MUST double buffer -- i.e. draw to a second screen while you show the user another screen, then swap the two when you have a new screen created.
2) It's much better if you want to vertical scroll and NOT horizontal scroll, 'cause you can word align your blit area.
3) If you want to horizontal scroll, the fastest way is to pre-shift the entire playfield that you're scrolling, and word-align blit the rasters into your double buffer.
4) You can keep a gigantic map elsewhere and blit sections of it to a "window" within your screen, scrolling within the screen, so that you avoid the hit to scroll the entire thing.
5) Generate your scrolling screen on the fly by blitting lots of little pre-shifted squares (16x16 is the usual choice), using your own bit blit routines.
6) If you don't need the functionality of the logic operations from the VDI and LineA routines, then write your own blit routines.
If you're using 16x16 sprites, even a bitblit written in C will outstrip the system (I know, I wrote one for grins).
Larger areas must have assembly.
7) Use the blitter if possible.
8) Buy an STE, they have hardware support for fine horizontal and vertical scrolling, and darn if it ain't pretty to see!

Hope my ramblings help ;-)

>

..but you may just have exposed yourself to a whole lot of 'if you're
going to do it, I want it NOW!!' messages. Sounds like a sensible thing
to do, though. It'll require a new case for the STe, won't it? I
wonder what implies for the Mega range?
>
>>Can someone from Atari also post the specs on the SIMMs the STE and STACY
>>are supposed to use?
>
> I don't know them. The SIMMs are there mainly for the cost and space
> savings on the PC board, not so you can add memory to your machine.
>
> In some machines the memory is not even socketed: it's SIPs, not SIMMs.
> If the cost of SIPs is lower than SIMMs plus sockets at the time we
> buy, we use SIPs.
>

Oh dear. Anything to save a buck. Just when we were thinking how nice
it is, having a machine which is certain to be easily upgradeable. I
thought Atari might have learned its lesson from the time when it made
Mega 2's which couldn't be upgraded to 4 meg. It really is a
short-sighted attitude.

(None of this implies any personal criticism, Allan. I doubt whether
you're responsible for this.)

[Apropos of nothing, as I have a few more lines to insert to defeat the
'50% new stuff' rule, I see that the Atari Transputer Workstation is now
being openly advertised as 'available now' in the magazine
Parallelogram. For 4995 pounds, you get a T800 processor, 4mb RAM,
graphics processor, 1mb video RAM, 1280x960 colour graphics, X-Windows,
Helios O/S, and either a C or a Fortran compiler. Contact Perihelion on
+44 223 356555 for more details. Oh, and 'Available soon: Ethernet Link
Adaptor'.

The same issue (Feb 90) has an article which hints at a financial cock-up at Perihelion. It looks like Atari UK are now going to make the ATW themselves, with the assistance of 5 ex-Perihelion employees, while Perihelion Hardware Ltd. (new name, formerly just Perihelion Ltd.) will distribute it, and make & distribute peripherals for it. Atari expects to expand its ATW staff to 14 by mid-year (whenever that is - calendar, financial?)

I was interested to see the report on how the Kodak ATW-based image manipulator is now on public view in Toronto. I saw it at the UK Personal Computer Show last September, and was very impressed. What a great tool for blackmailers it would make! Get a photo of someone in a compromising position, then stick on someone else's head!

There, that should be enough. Sorry to ramble on.]

Graham

While Mark's basic desire to get rid of pirate bbs's is good, I do not
suggest anyone follow his suggestion. It is, of course, illegal. You
are not entitled to take the law into your own hands. Reporting the
offending bbs is the best thing you can do. Planting worms and
viruses, as mark suggests, can result in you getting into trouble as well.

1821. Re: Re: Bob Brod(i)e comes to Arizona (Michigan)!!

Newsgroup: comp.sys.atari.st
Date: 1990-02-16 17:45:36 UTC
From: daveba@hpsad.HP.COM
Message-ID: <750049@hpsad.HP.COM>
Source record: 243425

Bob Brodie visited our user group, ST ACE (ST Atari Computer Enthusiasts) of Santa Rosa, California last night (Thursday, Feb. 15). He is a down-to-Earth sort of fellow, and didn't seem likely to let anything "slip out" unintentially, even if "greased up" (sic). He showed a STACY, an STe, and a Lynx.

The STACY looks and feels very nice. They have been having problems with the vendor who supplies the internal hard disk drives, which is hampering production. (Note: I work for a large electronics company and this sort of thing happens all of the time. Projects slip, manufacturing is held up for all sorts of reasons. This is not unique to Atari!). Bob clearly stated that initial advertising will be directed at the MIDI market (e.g. musicians), so don't expect widespread, general advertising. The music people have responded very favorably to the product so far. Eventually, Atari hopes to capitalize on the Mac emulation market, with the help of the very cabable Spectre GCR. Initial production will be of the high-end 4 MByte RAM version, with internal 40 MByte hard-drive. There will also be a 2 MByte version of this beast as well. Further along will be the 1 MByte version, with two floppy drives, aimed especially at the educational market (Johnny's first computer for college, etc.)

The STe looked and behaved much like a standard ST. Bob demo'd a game that supposedly showed off the improved sounds and graphics, but as a mono [read serious! :-)] user, the improvement may have been lost on me.

The Lynx (the handheld color game machine) also looked nice, and judging by the reaction of the kids present at the meeting who played with it, it should be a successful product assuming the little beggars can talk Mom or Dad out of $159! The Lynx is supposedly availabe through the Sears mail-order network right now. Bob also showed the commercial that ran in the New York area during the last holiday season - it was a very well-done commercial (This is the "bathroom" commercial, for those who might have heard of it).

Bob impressed me as an honest, caring individual who is doing the best he can. Perhaps with his help, Atari's notoriously poor relationships with user groups, programmers, customers, dealers (have I left anyone out?) will improve.

I had two students back to back yesterday who own a MacII and a
MacPlus.

I demonstrated how fast NeoDesk is ... had a file sitting on the
desktop.. clicked on it and blitted it to the screen in about
the time it took my finger to leave the mouse. Then i took
them into Tempus II and their eyes were bugging out. Both
agreed that what they saw was faster than what they get on
their macs.. then i booted into GCR and wowed them with
the "welcome to macintosh" thing..

they had a hard time pronouncing "atari" ..

who's fault is this? i am quite certain that these same individuals
who spent well into the thousands on their systems might have
considered the ST had they even known about them... i don't
think the US citizen inherently is not as CAPABLE of appreciating
the ST... after all.. people around the world are generally rather

similar. Europe is already convinced by ATARI.. it is certainly
time for ATARI to expand its market by making an effort to
convince the US consumer. The off the street cost of an ST is
still below the cost of an educational discounted mac.
Has anyone ever seen an ST on a school listing for
computers available for educational discount?

I don't think we can even compare market repsonses until
Atari even commences to announce their products in the US...

> I recently picked starstrk.acc from the net. Looks marvellous, but once I
> took it off the list I could use my TurboC again. What a pity.
>
I quite like starstrk, and I don't think it's interfering with anything
I use (I haven't tried it with a GDOS boot disk yet), but I find it
variable. Sometimes it starts up automatically after about 3 minutes of
idle time, as it's supposed to. Other times it doesn't start up
automatically at all. It looks like it works OK for the first period of
idle time after a startup/reboot, but not for subsequent times -
however, I've not made systematic notes of this, so I could be wrong.
Anyone else found this? Does PYRO work any better?

1824. disc testing

Newsgroup: comp.sys.atari.st
Date: 1990-02-16 18:09:53 UTC
From: pjj@r2.uucp
Message-ID: <690@m1.cs.man.ac.uk>
Source record: 243488

I am trying to write a floppy disc tester to check the magnetic medium.
i.e. write a known pattern to disc & check that it is there on reading.
(and perhaps patch the FATs (& directories?) if it finds a new fault)

1) Although formatting sometimes detects faults, why doesn't it always do so ?
Is it because I need to use several different test patterns (slow) ?

2) Does such a program exist already ?
If not, would people like a copy if & when I get it working ?

3) To speed things up, I am trying to access a track at a time. With 2-sided,
9 sector per track discs, rwabs will not let me read 18 sectors, but will
let me read 9 - is this as expected ?

4) I would also like to reposition the read/write head over the next track
while I am checking the previous track - how can I do this ?
Are there any other ways to speed things up ?

5) I suspect that TOS will automatically check the sector(s) written to disc
for me - is this so ? how can I turn it on (or check that it is on) if it
is optional ?

6) Like an idiot, as I was using C for the first time, I accessed drive '0'
instead of drive 0 (i.e. 0x30 instead of 0x00) and got to my hard disc.
Which partition did this access ? I think that I corrupted a sector & want
to get the right replacement from backup.
Which hard drives can be write protected ?
Is there software available which will "write protect" my hard drive ?
(I don't mean virus-proof it)

7) I have been offered a formatter that will give 11 sectors per track. Could
anyone with experience of using discs with 10 or 11 sectors per track
comment ?

Thanks for any help that you can give me.

1825. GDOS fonts, metafiles

My drive is having difficulty reading bought (or rented) programs. I also have problems when I swap disks with other people. They don't always like to work. Sometimes I get a directory, but it looks completely mangled. I have a drive speed tester, and the speed is right on 300. I opened up my drive to see if there was anything else wrong with it (well, curiosity mostly drove me to that). Does anyone know what could be wrong? Also, there are two pots (or variable caps) on the top of metal case housing the drive. Which is drive speed and what does the other one do?

I have carried my 520 (purchased in the US) both ways across the border at Champlain NY with no problems or questions from US or Canadian customs. My guess would be that if you purchase an STe in Canada and declare it through customs, they will not care or know about FCC certifications. That was our experience bringing in a 'Canadian Honda'. We had more trouble from the Commonwealth of VA than from customs.

>"to lie"?).
>

I am a forensic pathologist, and have acted as an expert witness in
numerous trials. I almost always bring photos along with me, which
counsel uses as evidence.

As far as I know, photographic evidence that *I* am involved with,
and all the photographic evidence that I have ever seen admitted
from other scene investigators has always been admitted only on the
conditions that

1) It can be shown that the photo is a "true and accurate representation,"
of what was there, and

2) It has usefulness in explaining my or some other investigator's
testimony, e.g. it is not admitted as evidence in and of itself.

Your question is about problem (1). The way this is almost always done
is for the person who took the photo to be on the stand and testify
thay this is, indeed, a true and accurate representation. Thus, if
I took the photo, then I would be the one who did the testifying that
the photo is not tampered with.

The tampering question is an old one for us folk who do autopsies,
but the question was of tampering with the body rather than with
the photo. For instance, let's say that John Doe has been shot in the
stomach. John survives long enough to get to a hospital, where
they open his abdomen to try and close off the bleeding arteries, but
he dies anyway.

Joe's body comes to the morgue with this itty-bitty hole in the belly,
and a huge old surgical wound running right through it. Defense will
often get any photographs of the wound ruled inadmissible because
of the gross looking surgical wound -- the judge will rule that the
jury will react viscerally (no pun intended) to the large wound,

rather than intellectually to the evidence of the bullet wound.
I have also had photos ruled out because there was too much free blood.
The wound wasn't cleaned (I often take one shot uncleaned and one
cleaned), and bloody wounds often look much larger than they are,
expecially in photos. I have also had one ruled out because
skin traction caused a knife wound to gape open, again making
it appear larger, in some sense, than it really was.

Thus, when I take a morgue shot, I often spend a lot of time carefully
draping towels, arranging the body, etc. to hide any extraneous stuff
in order to make my photos of the wound admissible. Then, when I get
on the stand, I testify that the photo is a true and accurate
representation, with the exception of whatever modifications I have made.

I suspect that digitization problems will be handled the same way.
Since photographic evidence is almost always admitted only as an
"illustration" of personal testimony, it will ultimately be admissible
to modify a photo to "clean up" extraneous stuff, as long as somebody
is there to testify that the stuff appropriate to the case is true and
accurate. Haggling over what consitutes "cleaning up" and what
should be left in is something that counsel should get settled
during disclosure. As far as the question of being able to
sneak in a modified photo, this has always been a possibility and
this is why 1) it is usually admitted only as "illustrative" evidence, and
2) there has to be someone there to hang for perjury.
The precedents are pretty much there already.

Now, the ease of proving perjury might be made very much more difficult.
But that is a different question.

1830. SPECTRE GCR & THE SC1224 (yes, it can be done!!!)

Newsgroup: comp.sys.atari.st
Date: 1990-02-16 20:37:10 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <900216.14370871.037058@SFA.CP6>
Source record: 243491

Hello folks,

FIRST, THE BACKGROUND:
A few days ago, line noise so froze up my modem that I decided to power the modem off and power it back on. Upon powering it back up, my SM 124 monochrome monitor suddenly gyrated, displaying the screen in two halved parts. A few seconds later, everything went black. No, it was not from my passing out! I powered the ST down and rebooted, using my RGB monitor. The computer ran fine and the RGB looked great. The monochrome is STILL dead.
I have no idea how switching modem off and then back on caused my monochrome monitor to die but, at any rate, I don't have monochrome. And nope, there are no other STers within 250 miles of me so that I can test the monitor on their equipment. I assume the monitor is dead and not something on the computer. But I don't know. If anyone with some documentation (what is documentation on an ST???) can come up with a clue, please let me know!!!
To end the background to this, I run Dave Small's wonder Spectre GCR!

NOW, THE REST OF THE STORY:
With fear and trembling, I decided to use the SC1224 with the Spectre. Well, Dave (bless him!) has an explanation with suggestions on setting the pallette with optimum color combination so that the display is readable. However his explanation does not fit my Control Panel settings too well. But he does tell us that if you use two shades of grey that the display might look pretty good.
So, that is what I did. Using the Atari Control Panel, I fooled around with the colors and I managed to get an acceptable display. SERIOUSLY! Just leave the white and black squares alone. Change the remaining two squares to two shades of grey with the values 333 for one of the squares and 444 for the other. It does work. In fact, I'm typing this using Red Ryder while viewing with my SC1224.
A final note and most important. You almost GOTTA have four megs to do this right. I am running MultiFinder with 900k setup in the system heap to insure that MultiFinder runs perfectly. The cursor key is just too slow without MultiFinder!!!! To get the cursor key to move at a useable rate, you have to use MultiFinder.

CONCLUSION:
Well, we STers are a hardy lot, making do with what we can muster. I've no documentation for my ST, none is available except for the $250.00 developer's kit. I have no idea if my monochrome monitor is dead or not since no other STs are in my region, and, thanks to Dave giving at least some support to the RGB monitor, I still have a workable, albeit fuzzy, Mac display.
If any ST techies out there feel that the problem is not the monitor,

please let me know!!! THANKS

Larry Rymal: |East Texas Atari 68NNNers| <Z4648252@SFAUSTIN.BITNET>

>/Taka Sajima
>sajima@watsun.cc.columbia.edu

E.A. Brown offers two different interface boards that one can use to hook up a Multi-sync monitor to the ST. The output for color is superior, the output for mono is good but not quite as nice as an ST mono (one must view everything through the color mask, which slightly blurs the mono image). Very acceptable though, well worth it if you have the cash for the monitor itself. Costs for both are under $100, one is a multi-function switchbox (drives, monitors, audio & composite outs, etc), the other is strictly for the multi-sync connection (this one is about $50, I think).

1834. The Phantom Typist

Newsgroup: comp.sys.atari.st
Date: 1990-02-16 22:14:00 UTC
From: SOCS18@vaxb.york.ac.UK
Message-ID: <9002170704.AA25296@ucbvax.Berkeley.EDU>
Source record: 243492

I don't think the phantom typist is not caused by the ST missing a 'key released' signal. If you turn off all interrupts and then move the mouse, the ST behaves as if it has received _lots_ of keypresses. It doesn't slow typing down as reported.

I've never seen 'The Phantom Typist'. What has happened to me in First Word Plus, using a disk based versiuon of TOS 1.4 (8/8/88 version), is that the program simply locks up while I'm typing quickly. No chances to save, it's gone.

This may be a problem with my old copy of TOS 1.4, but until I can buy some ROMs from Atari UK....

From: SOCS18@vaxb.york.ac.UK
Message-ID: <9002170705.AA25353@ucbvax.Berkeley.EDU>
Source record: 243494

I wrote a screen blanker in the style of "Stars" for the Mac, as one of the other columnists for ST World requested it. I've never seen "Stars", so I had to guess at the SFX, but Steve Cassidy (who did the requesting) says he gets giddy if he watches it for too long!

I only know of one incompatibilty (with the clock display of Tempus 2), and it should work on the STE and TT (Quite a bit of work went into this, but I've not had chance to test it yet).

It's an accessory written in assembler, but I could attempt to post a uuencoded version of the ARChive, if anybody is interested. (I can't access the .binaries group...)

1838. MINIX and NETWORK connections

Newsgroup: comp.sys.atari.st
Date: 1990-02-17 02:56:55 UTC
From: whitten@kuhub.cc.ukans.edu
Message-ID: <22274.25dc6917@kuhub.cc.ukans.edu>
Source record: 243414

After reading thru the MINIX newsgroup, my intrest about ST MINIX has really grown... I would love to hear from anyone out there that has purchased the package, as well as anyone else who has two cents to put in. Specifically, does it support multitasking, multiple users, that kind of thing? Can you still run TOS programs from inside it? Would you consider it useful to people who aren't real unix gurus?

Also, along that same lines, what about Dave's Multitasking C-Shell? Can it do any of the aforementioned neato-keen stuff?

Also, further down that same set of lines, I'd love to get some feedback from anyone who has a form of UUCP running on their ST, and USENET ect...

Thanks for any light you can shed on this,
Chris

1841. Another PC Speed Update

Newsgroup: comp.sys.atari.st
Date: 1990-02-17 03:30:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <90Feb16.223314est.57891@ugw.utcs.utoronto.ca>
Source record: 243444

After a lot of flakey behaviour with my newly installed PC Speed board, I opened up my Mega and resoldered the 64 pin socket onto my 68000. The board is a lot more stable now but not completely so.

Here is a list of some of the stuff I have tested.

1. NORTON Utilities (SD, SI, LD, NCD [NCD no longer locks up])

2. PCBoss

3. WP 4.2 (no longer locking up with fast help screen changes)

4. dBASE III Plus (also not locking anymore with fast menu changes)

5. GEM 3.01 desktop can be installed but it is just as slow as on a real XT. Word Plus, GEM Paint also tested. They work for a while but after a few minutes the machine just hangs.

Before the flames hit, NO, I don't see any point in using PC GEM on an ST under PC emulation. Atari GEM is vastly superior, especially when running NEODESK. However, I wanted to test applications that were graphics intensive. Looks like bad marks so far!

6. LOTUS 123 ver 2.01 worked fine. No hangups found yet.

7. Smart Term 240. When connected to a CYBER (that's how I started this session) extraneous characters popped up all over the screen. Sort of looks like a parity problem. To continue the session I did a warm boot back to Uniterm (didn't drop the line).

I have used VersTaTerm Pro and Red Ryder on Macs and Crosstalk, Kermit Connect, Zstem and Smart term 240 on PCs and not one of these is as versatile and easy to use as Uniterm on the ST. Thank you Simon Poole, wherever you are.

1842. Suggestions

Message-ID: <90Feb16.224135est.57546@ugw.utcs.utoronto.ca>
Source record: 243446

1. On the UIS, have a button that says RUN PROGRAM. Then, a user could run another program from within any program that accesses the UIS.

2. ALT-click on a file ICON in NeoDesk to call up a comment field to affix annotations to files (much like NORTON's FI.EXE)

3. Post digitized photos of Atari staff so we can see who we're 'talking' to.

4. Put a FAX machine in Avant-Garde's office so messages can be sent through. I have tried at least 20 times to call and cannot get voice connection.

5. Put a toll free 800 number and a FAX to send messages to Atari USA

6. Send me cash in small unmarked bills so I can pay my lawyer's bill (the custody battle was hell).

1843. Anyone know about MT C-shell?

Newsgroup: comp.sys.atari.st
Date: 1990-02-17 04:03:50 UTC
From: rcb@ditka.UUCP
Message-ID: <20967@ditka.UUCP>
Source record: 243447

I've been trying to get a hold of Beckemeyer Development by phone for some time now. I got the number out of a recent STart magazine and dialed the number. It was disconnected, but gave a new number. I then called the new number and have only succeeded in getting an answering machine saying that Beckemeyer Development was not available and would get back to me soon. I left a message twice, but have not heard a thing. Anyone know what happened to Beckemeyer?

So, I only know what the advertisement said about MT C-shell, which was that it is multi-user, multi-tasking, runs GEM programs and as an option, UUCP is available. Sounds good (maybe too good). Is it really multi-user, multi-tasking? I doubt this because someone told me that he didn't think the Motorola 68000 chip had memory protection mode and, in light of that, it would be impossible for a 68000 to run multi-user. Also, does the MT C-shell come with any Unix utilities and, if so, which ones? What do people think of it? Is it just as good to get a public domain, multi-tasking kernal such as MX2?

Thanks for any experiences or knowledge you can share ...

Source record: 243438

Dear netters,
Thnaks to the man who sent me the nice gwbasro of version 2. Unfortu-
nately i had this before and the Bstatprogramm of Prof. Liebowitz was
not in gwbasic 2. Another man asked me where i had the gemini from and
i can only say i haven't it from the net, but of friend of mine. The
problem i have with bstat seems to be with the corrupted gwbasro in the
arc, with could come from net problems. The way of the arc i must take
is normally IBM - Siemens BS2000 - PC - ST. Of course someone has got
the bstat and could mail me a correct version of gwbasro. The problem
with opus chart features seems to come from the bad gdos version i have.
Of course the printer driver of the gdos, which came with gemini are bad
I tried to use the gdos of timeworks publisher, but no better results.
Of course someone in the net has a pure version of gdos or it is some-
where in the net.
Any information is appreciated
Thomas Neser <So01@Dmarum8.Bitnet>
P.S.: To TEX
I think best way is to put TEX in the server on Ueguelph. If someone
can give me the postal adress of the admin i can send him the disks.

Sounds EASY, LOGICAL, PORTABLE etc. If now someone@atari would say:
"Do it this way" this would make a fine standard. At least it's better
than all other proposals.

Subject: value of 1040

I am considering selling my 1040 if I can get a good price. Does anyone
know the going price for the following system?

1040st with color and monochrome monitor.

Also comes with the following software.

Pagestream 1.8
DBman (version 1. I believe, I never upgraded.)
PSION chess
Leader Board
Degas Elite
1st Word
Assorted Pub Domain

Please email me directly, I do not receive this digest.

Thanks,

Norm Frech (frech@MWRAAA.ARMY.MIL)

Your explanation of why Atari releases products in Europe before Noth America isn't too convincing. Atari does NOT regard N.A. as a potentially larger market than Europe, since they do very little to supply and service N.A. Something like 90% of sales are in Europe. The real difference is that in Europe Atari is established as a machine that can do serious work, it got in before IBM and the Macintosh and is doing well; whereas in N.A. it has a poor profile and marketing is a constant upward battle.
Canadians understand this idea of our being regarded as peripheral to the main market very well. Perhaps this is why we have coped with it and, as a result, the ST is doing far, far better in Canada than south of the border. Americans, on the other hand, are outraged at the suggestion that they are not the centre (Cdn. spelling) of Atari's strategy. I'd add that, in general, Americans are outraged at the idea that they are not the centre of the world, but that would be a cheap shot. Besides, they are awfully nice people, if a little self-involved.

I didn't follow right away, but now maybe I understand. It's the nature of dialog boxes that the program state is different after using one. Sometimes the state is unstable (perhaps there's a new working copy of a string which needs to be validated and moved to the permanent string). Sometimes the display needs to be changed (consider choosing different display sizes in a page layout program). It's very tempting to assume that these functions will only be needed after a redraw is requested at the end of a dialog. If FORMDIAL suppresses that, and if those functions are folded into the redraw code, confusion would result. The problem is one that becomes acute in multitasking: anything may change under you without notice, at any time.

Hello, STart magazine is still out. I really enjoy STart an awful lot, and to tell the truth I'm not too dissapointed that ST-Log went under. ST-Log never was all that great a mag. I ussually find it at any halfway decent bookstore...if they don't have it, maybe you can get a store to order it. It is really too bad that you can't get a subscription to STart without paying to get the disks too. I love the mag, but I'll be hanged if I am going to pay loads of cash to get stuff on a start disk, most of which is useless to me!

>fonts and select font calls. I have Gdos loaded already..

Yes in fact you do! C! Call vst_load_fonts(handle,select) where h/dle is your virtual workstation handle, and select is 0. All of your fonts will be loaded into memory in one time-consuming bunch at this point (this, I am lead to believe is what is meant by setting select to 0, future revisions of GDOS will allow you use other numbers, in order to select specific fonts to load).

One useful thing to do just after loading up fonts, is performing a call to vq_extnd(handle,owflag,work_out), where owflag is set to zero, meaning you'd like to know the current status of the regular, non-extended work_out variables. work_out[10] will contain the number of fonts available to you now. To know the names of these fonts, or anything else for that matter, you can use the calls vqt_name and vqt_fontinfo respectively.

To set any particular font, simply call vst_font(handle,font) where font represents the N'th fonl loaded by vst_load_fonts. What you can expect back from the call is the font number (that integer that is unique to each GDOS face) :-(I've always wished that you could call the fonts by this ID rather than the way things really work.

Above I mentioned a future release of GDOS, the ramifications of this are, unfortunaltely, that your version 1.1 is the latest to be released. We can all dream of 2.0 (which the rumour mill says is on its way), the features of which I won't speculate about (although if you live close to a rumour mill, you're sure to hear about individually loadable fonts, bezier curves, maybe even outline fonts :-)))

>didn't think the Motorola 68000 chip had memory protection mode and, in
>light of that, it would be impossible for a 68000 to run multi-user.

Well, MT C-shell is at the least multi-tasking, I believe it was written
with the Micro-RTX multi-tasking OS extension, which I know for a fact is
multi-tasking. As to whether or no the C-shell is inherently multi-user,
that I don't know, but if it can multi-task, it can support another user if
you write the code.
The 68000 has user and supervisor modes, but this has nothing to do with
multi-tasking. Any microprocessor can multitask, just look at MP/M (a
multi-user, multi-tasking C/PM thing). It ran on a Z80, which didn't have
much of anything.

Message-ID: <5819@blake.acs.washington.edu>
Source record: 243307
Cross-posted to: comp.music,comp.sys.atari.st

To owners and potential buyers of NOTATOR for the ST:

As a user of NOTATOR myself.. i would like to see
some improvements in a few areas. I am sure others
out there have their personal grievances and wish lists.

I would like to collect your suggestions and create a
compilation file that i will present to the reps
at C-LAB. I AM NOT AFFILIATED WITH C_LAB! Just a user
who knows that changes won't be made unless a good portion
of the user base insists on them. Please email me your
suggestions... after a time (not sure when), i will
present the info to C-LAB with the hope that we can
improve an already great package.

Here are a few of mine:

1) Make it work with Jim ALlen's Turbo16 accelerator board
2) Support for MONITERM and large screen display.
3) Print spooling
4) Postscript support (for importing files into PS document processors)
(as well as the obvious)
5) Ability to print when a RAM Disk is installed (perhaps certain ones
already allow it.. i would like to know)
6) Greater Laser Printer support.
7) When entering a note with the mouse, we need a "register"
that indicates the exact pitch as the mouse moves across
the staff a la music studio.

email me at ramsiri@blake.acs.washington.edu

If for some reason you can't find my node, post it to the
net, and i will grab it there.. but, do your best not to
waste bandwith on this. Thanks!

Yes, STart is still available. We get it at our store. Do you have a Walden or Dalton's bookstore? Ours here also carry STart.

>Can anyone suggest a DS/DD ext drive for a 1040st (beside the 314)? I need one
> that is very inexpensive and something that will hold up. Has anyone heard
>of the BeaST drive?

Yes... the BeaST is a nice drive. We sell the MaSTer drive at our store. The main reason we chose the MaSTer over the BeaST is that the BeaST doesn't have an output port... only input. MaSTer has both. The price is about the same for both drives. (They list around $230. As an example, we carry the MaSTer for $150.) We've had many people who have been very happy. The MaSTer is only slightly larger than the BeaST. (Certainly not significantly so... it's 2"x4"x8".) The MaSTer uses the Chinon mech. The BeaST uses the NEC. (Same mech as in the GTS-100, so users of GCR may wish to beware.) We have also sold the BeaST and have no reported problems as well.

Hope that helps!

Holly

>BTW If anyone has other PD Calamus Fonts - please send them to me :-)

The reason they're missing letters and things is because they are *not*
PD fonts... they are demo versions of Shareware fonts from Sol Guber
(S.GUBER on GEnie). You should also have received the ReadMe files that
indicate how you can get full alphabets. I believe his price is quite
reasonable, and is based on the number of fonts you get... if I remember,
it was about $12 US a set.

Look for the MS fontsets that will be distributed shortly as well... they
are quite well done and very interesting.

1868. SIPs and SIMMs

Newsgroup: comp.sys.atari.st
Date: 1990-02-18 02:07:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <90Feb18.094151est.58275@ugw.utcs.utoronto.ca>
Source record: 243305

Alan Pratt made the statement that Atari puts in SIPs or SIMMs depending on what is cheapest at the time. First of all, I am not very hardware literate and the comment does not mean a heck of a lot to me on the technical side. However, on the support side, it means that I cannot tell someone what is inside his/her STe until I open up the box. Atari Canada told me that the STe may or may not have sockets for SIMMs to boost the memory to 4 megs. How can anyone promote a computer when he has to take his chances and guess what is under the hood? What a nightmare situation.

I would like to see an official Atari statement about (i) large screen monitor support and (ii) memory upgrade capability for the STe. NO DISCLAIMERS on this one please. What are the official specs for the STe for these two features? If Alan cannot give an official spec, get someone else to do it.

1869. OK, so they sell the STe

Newsgroup: comp.sys.atari.st
Date: 1990-02-18 06:16:58 UTC

Message-ID: <900218.00165749.037772@SFA.CP6>
Source record: 243315

DAVID SCHREIBER stated:
>....the ST is doing far, far better in Canada than south
>of the border. Americans, on the other hand, are outraged at the
>suggestion that they are not the centre (Cdn. spelling) of Atari's
>strategy. I'd add that, in general, Americans are outraged at the idea
>that they are not the centre of the world, but that would be a cheap
>shot. Besides, they are awfully nice people, if a little self-involved.

I take exception to the above statement. I'm not outraged at
Atari U.S.A.. No, I'm hurt instead and feel betrayed. I rejoice
that at least some nation in the North Americas is getting decent
treatment for its users. Relish your ST market, Canada, and don't
take it for granted!
I could care less if the U.S. is the center (U.S. spelling - grin)
of the ST market. What I do care for is that I can get reliable info
about my computer which I've invested money in and be assured that the
computer which I've put my money and time into will still be around
and supported. I feel betrayed for I have no idea whether or not
my ST will be an orphan or not by the end of this year.
Here are areas which I feel betrayed in:

1. The Mega2 ST. I bought it because I was *assured* by the man
himself during a convention that it would be the front-end for
the ATW. That idea was abandoned. Fine, but the assurance came
across as fact and was literally promised as fact.

2. Education. As an educator, I was assured that Atari would pursue
an aggressive marketting strategy for schools in a manner similar to
that done for the Pets of ten years ago. Our school has yet to
receive a reply from Atari regarding the stocking of a music
lab utilizing MIDI. Apple Mac will more than likely win the bid
since they at least responded.

3. Documentation. As a user, I cannot find 'official' Atari documentation
designed for users that is of technical nature. Docs that come to
mind is that similar to the technical manuals SUPPLIED with the
Amiga 500 and optional manuals similar to the Commodore 64 or 128
Reference manual. Are we Atari STers rated any less? No, but as
far as docs are concerned, the ST seems to be built for developers, not
for users.

4. Stagnant software. Software such as TimeWorks Desktop Publisher
is buggy and will not be upgraded due to the lack of ST exposure.
I bought the product several years ago. A more aggressive market
might have caused that program to be expanded.

5. 3rd market support. Well, a bright spot. It is fantastic. Due to Dave Small, Gordon Moore, George Woodside, the CodeHeads, DoubleClick, and others, the ST continues to keep its head above water. WordPerfect also sees a market potential.

These are just rambling items in my head that come to mind as I compose this on-line. However, and again, I don't care if the U.S. market is the center or not. I just want promises made to not be broken, follow-up on correspondence, and customer support. As an ST user who has sunk some money into the Atari ST since summer of 1985, I feel betrayed by Atari.
Ok, enough of this. I normally don't flame and will probably get scorched. SIGH

Source record: 243313

I have recently reviewed some of the information about the ST port of GNU C and am *extremely* impressed! I'd like to use the package soon, but I would prefer to write and compile my code on a Sun, then transfer the binaries over to my ST later.

How difficult would this be? Will the package compile normally on the standard Sun C compiler? Any help would be appreciated.

If possible, send me mail directly (to MCCABE@MTUS5.BITNET) since I don't get the chance to read these groups as often as I like...

This isn't even funny. The idea of planting viruses to "punish" pirates is ridiculous, because the virus is almost guaranteed to spread beyond those you are trying to punish. I hope this suggestion was made in jest, but even so, it shouldn't have been made.

>which is potentially smaller, rather than in the one which is potentially
>large.

Personally, I believe Atari UK were forced into distributing the STE before Christmas simply because they'd run out of STFMs. This can be seen if you read the trashy ST Format this month when they again slag off the STE as a 'Christmas turkey' and tell us that 'What went wrong?' was that the wonderful British games companies were not given enough time to test out their games on the new STE to see if they still worked.

I can see their point - the software houses might have had enough time to correct their illegal coding and hopefully old game stocks would have been sold out by the time the STE was launched, leaving a new stack of 'STE friendly' games on the shelves - if the STE was launched, say, now...

ST Format, in their article 'The STE - what went wrong?' claim in their opening paragraph that except for 'one or two' programmers who were disappointed with the machine everyone was eagerly awaiting the STE's launch. This is quite a turn-around when you consider it was them who, a few months ago, published the article in which a large group of programmers slagged off the machine. Instead of their 'Lets slag-the-STE' attitude, they've now taken on an 'What-a-damn-shame-we-were-really-hoping-the-STE-would-be-great-what-a-shame-for-all-those-readers-who-bought-one-and-now-can't-get-Kick Off-to-work'

At least when the STE finally makes it to the US there shouldn't be any of this nonsense since all the problems with the STE will have been discovered by the Europeans (guess that includes the Brits!). Hopefully Atari's image will be inhanced by a squeaky clean launch with no ensuing problems rather than damaged as it undoubtably has been in the UK. Of course we wouldn't have these problems if programmers didn't feel that accessing the hardware is justifiable, ah well...

Mark.

PS. Would Atari consider quietly releasing TOS 1.61 which fixed the simple bugs in TOS 1.6? People can live with bugs that they never see,

but having to install an AUTO folder on EVERY disk they use is a bit of
a bugger.
(I hope this letter isn't screwed up - my terminal certainly is..)

>7) I have been offered a formatter that will give 11 sectors per track. Could
> anyone with experience of using discs with 10 or 11 sectors per track
> comment ?

I've used various 10/11 sector-per-track formatters. However, I stopped using them a while back after I seemed to be getting more disk errors then other family members on the same machine. Errors included desktop claiming a non-empty disk was empty (although if booted from, auto programs would work) - usually cured by a cold boot; erasure of the boot sector - which I was able to fix by copying a boot sector from another disk of the same format; and the final straw for me - complete erasure of all fat and directory sectors on the disk.

This would happen during completely normal disk usage, hence my suspicion of the extra sector formatters (although I'm not really sure).

Another thing: I remember reading in an old copy of the developer docs or the abacus disk book (sorry can't remember which, I don't have it here) about the minimum space needed for the control information (required for each sector) and the acutal available space per track, and concluding that 11 sectors is impossible: it won't fit (?!?), and 10 is very tight.

Does anyone know if extra-sector formatters are "playing by the rules"? Do they push the capacity beyond what it can safely hold? Is all this in my imagination? Anyone else having such problems? It would be really nice to get that extra storage. (-: It would be even nicer to get a hard disk :-)

>Atari ST User, Amiga Action and Amiga Computing. I do not think the new company
>will continue to run five magazines when it can get away with two.
>
>Therefore, I do not think that ST World will survive for long (the owners of
>the Database group, Europress, own Interactive Publishing).

Bl**dy hell! That's sounds just like what happened when two publishers
exchanged computer mags - one publisher consolidated his coverage of
Amstrad computers by gaining another Amstrad magazine and the other eliminated
a competing ST mag - ST Update which, admittedly wasn't brilliant but it
wasn't full of games and covered programming topics. I could do without
ST Action which is just full of games reviews anyway and I can do
without ST User since it no longer contains much of any interest but ST
World is in a class of it's own as far a British Computer magazines go.
I hope it doesn't turn into some ST User/ST World hybrid, I'd probably
ask for my subscription money back if it did....

Source record: 243348

Keywords : Interrupts

Re : Writing interrupt handlers in C

The problem with your interrupt routine hanging is probably because you haven't cleared the Interrupt in SeRvice (ISR) bit of the appropriate MFP register. I can't remember the correct bit and location offhand -- it's probably in 'ST Internals'.

If you don't clear this bit, then the MFP still thinks that you're handling the interrupt, and will not let any other interrupts start. This will lock up the keyboard, mouse, VBL and everything else handled via interrupts.

Hope this helps -

Message-ID: <9002190811.AA24875@ucbvax.Berkeley.EDU>
Source record: 243334

Terminating the _installation section_ of a TSR should simply be a matter of calling Ptermres() with the amount of memory your program takes up as one of the parameters.

This can be calculated from the basepage, and is TEXT+DATA+BSS+256
(The 256 is for the size of the basepage itself)

This should be all you have to do. It works for me (from assembler...)

1878. poolfix3

Newsgroup: comp.sys.atari.st
Date: 1990-02-18 23:08:00 UTC
From: Ritzert@DMZRZU71.BITNET
Message-ID: <900218230844.275515@DMZRZU71-UNI-MAINZ--GERMANY>
Source record: 243318

well, we have a program that triggers the tos1.4 pool bug. It is the universal TeX screen/printer driver by tools GmbH, Bonn (version 1.1w). The program probably does a lot of mallocs (or Mallocs?). The error appears when You close the first dvi file and start printing a second one without leaving dvi.prg. When I leave dvi.prg and start it anew, no problems...

In order to cure this bug i put poolfix3 into the auto folder (as the last program). Nothing changed. Then I reordered the auto folder and put poolfix3 into the first place. Result: the performance of dvi.prg slightly improved. Now we can look at 3-5 dvi files without system halt. The program worked without any problems under tos1.2 and even with tos1.2/turbodos1.05 for a long time. The fastload bit is not set.

So i conclude, that
a) dvi.prg may contain a bug which triggers the problem.
b) even poolfix3 does not completly cure the memory pool bug.

Question to Allan or Ken:
Shall I install folder100 in addition? Before or after poolfix3?
Or shall I install ONLY folder100 to slove this problem?

BTW, i just ordered an update to the software. The people at tools were not aware of this problem, so I think the present software will not behave better.

regards,

Michael Ritzert

You have to have an Atari to SCSI adapter, and a cabinet with power supply for for your drive.

A SCSI drive will not require any additional hardware. Some SCSI drives have given the SCSI adapter folks some problems in programming.

The MFM drives are cheapest, and usually have the least capacity. They require and Adaptec 4000A (or equivalent) interface board. (the board speaks SCSI, and ST506, the interface to MFM and RLL drives. It can control 2 drives. You usually see MFM capacities in multiples of 20 mb. This can add $100-$150 to the cost.

the RLL drives are stressed MFM's that yield 1.5 times the capacity.
You usually see RLL capacities in multiples of 30 mb.
You need an Adaptec 4070 (or equivalent) interface board. (about $150).

Also, out there are faster ESDI drives. There is an Adaptec controller for these also, but for the price you are usually ahead to get an SCSI interface.

The biggest, fastest drives are SCSI.

Source record: 243335

Hello,
I just caught up on reading the net messages, and noticed that quite
a few people are looking for a good screen saver. If there is interest, and
a few good suggestions, we (B&G Software ...yes, we are a new company) would
be glad to create one and release it as shareware. If enough people want it,
we will make it... just send me Email with your opinion.
We would also like opinions and suggestions as to what features you
would like in an alternate desktop... and any other utilities you feel you
might want.
Please do not interpret this as an add; We don't even have anything
to sell yet. We are just trying to find out what you need and want. It
will be a while before we get finished with the four projects we are working
on (and modify and improve them according to your suggestions). However, the
screen saver can be completed relatively quickly once we tally the replies we
receive over the next week or so.
Thanks for your suggestions.

Also available is a Meg a Minute backup by Dave Small and Dan Moore.
Two were printed in Start (or ST-log). Thise sweapt a disk by sector range to floppies. (This is why they pioneered the Twisted format for TOS disk).

80 MB in 80 minutes to 80-100 disks isn't all that bad (or good).

Cartridge Tape is the answer for 80 Meg and up.

If you mean, a program that lets you start GEM programs at boot-time, why
can't you just use the AUTO-boot feature in TOS 1.6? (In the Install-Application
menu. Select "AUTO" for Boot Status.) I know that the HEADSTART docs mention
some incompatibilities that might make you want to use HEADSTRT over the
TOS 14/16 auto-booter, but I've never encountered any problems myself.

1889. "ATARI ELITE..."-- * PLEASE CHANGE SUBJECT!!!

Newsgroup: comp.sys.atari.st
Date: 1990-02-19 03:24:07 UTC
From: kar7481@cuphub.cup.edu
Message-ID: <4323@cuphub.cup.edu>
Source record: 243251

Would it be too much to ask to PLEASE change the SUBJECT HEADER
on messages in the "ATARI ELITE ST Org. of Pittsburgh" thread!?!?!

The constant posting of "xxx yyy zzz piracy..." under the SUBJECT HEADER
mentioned above is likely to give quite a few people THE WRONG IDEA!
^^

I know of no ST usergroup who desires to be associated with piracy--
THE ATARI ELITE of Pittsburgh is *NO EXCEPTION*

Might I suggest a NEW SUBJECT THREAD like "PIRACY...ZZZ YYY XXX..."
or something of the sort?

P.S; To all who'll be attending the T.A.F. show on April 1 in Mississagua,
Ontario-- Be looking for Blue-And-White-clad Americans with the urge
to help Canada's economy--(There should be 30 or so of us... :-))

Again, let me reitterate-- PLEASE DISASSOCIATE THE ABOVEMENTIONED
USERGROUP WITH PIRACY---IF ANYTHING WILL KILL A USERGROUP,
IT IS SPORATIC,SPOTTY,UN-FACTUAL ACCUSATIONS THAT
HAVE NOT BEEN INVESTIGATED!!!

To those who hurled the "Atari Elite = PIRACY" stones:

Please take the time from now on to find out just who
owns the glass you will be attempting to break.....
(and also if it is justified [without FACTS])

RE: The comment made by Mickey Boyd at (FSU?) about an "ELITE" level existing
on most BBS's.....Thanks for clearing this up for me----I was having
trouble figuring out how to summarize it 8-)

As Mr.Boyd said, ELITE on *** SOME *** boards refers to a secret level
that only a fistfull of pirates have access too...

BUT ONE MUST REALIZE THAT ON *** MOST *** BOARDS, THIS LEVEL IS RESERVED
FOR THE SysOp and/or CoSysOp's PRIVATE USE such as possibly Beta-Testing
a new software modification of some sort.

Ps#2; To those I may have offended with an earlier "NASTY-WORD(s)" post,
I have CANCELled it as of 4 days ago.....I realized that losing my
temper was NOT the most effective way to remedy the situation.
So, to those whom I have offended--I apologize.

To those I have ANGERED-- grow up.

According to MacWeek, Apple sold 1.5 million Macintoshes last year alone.
IBM shipped 1.25 million PS/2s, not to mention all the clones.

According to AmigaMail, the millionth Amiga shipped about a year and a half
ago.

Yes, there are a lot of STs out there (enough to keep us all afloat), but
they ain't exactly taking over the world. Oh, well. The geniuses are often in
the minority until the slower masses catch up.

%Original-posting-by: dc@dcpc.UUCP (Don Curtis)
%Original-subject: Conner CP340 specs
%Reposted-by: emv@math.lsa.umich.edu (Edward Vielmetti)
% I got the Conner Technical Manual today...here's the official
% word on both drive parameters and jumper settings:
[deleted]
% While the drive DID show up as SCSI 0 with E2-4 OUT, it was VERY
% flakey. It would only boot when it felt like it, and would go
% off-line at odd times for no apparent reason. Also, doing an
% ASSIGN command (NOT info command) showed DH2: thru DH8: as
% existing (with only 1 drive attached to the SCSI bus). Two drives
% on the cable would not work at all...either neither of them showed
% up...or both showed up as the same drive. Yes, they were jumpered
% for different ID numbers.
%
This sounds familiar, but I'm surprised that a mere jumper change fixed the
problem. I'd heard that when the controller on the Conner drive picked up
a query for any device other than its own number, it would park itself. I'd
also heard that the fix required replacing the conner scsi controller.

% Based on the message by Darrin (???) earlier...I reversed the sense
% of the above SELECT settings (that is...changed the "out" to "in"
% and vice versa) and put all jumpers IN. Drive again showed up as
% SCSI ID 0 and this time, ASSIGN only showed DH2: as existing. The
% flakieness was GONE...the drive works perfectly. Adding a 2nd drive
% works fine also.

Thanks for the info. These are really great articles, guys.

>multi-user, multi-tasking? I doubt this because someone told me that he
>didn't think the Motorola 68000 chip had memory protection mode and, in
>light of that, it would be impossible for a 68000 to run multi-user.
>Also, does the MT C-shell come with any Unix utilities and, if so, which
>ones? What do people think of it? Is it just as good to get a public
>domain, multi-tasking kernal such as MX2?

My big gripe with MX2, besides the fact that it stopped working when I got TOS 1.4 installed in my machine, was that it didn't propagate your environment to the spawned processes. (My next gripe was that it's written in Modula-2 and it's far from apparent how to modify it to this poor C programmer/Unix hacker... }-)

Hm. Granted, a 68000 running at 8MHz pushes as many MIPS as a Vax 750, do you *really* want to turn your machine into a multi-user host? (I've never understood the BBS oprerator mentality, sorry. Why the *hell* would I want to turn loose a bunch of unfamiliar hackers on the machine I've slaved over for so long? Why would I want to donate a phone line or two for other people to use, dedicate an expensive modem to their use, etc.? I shelled out a lot of hard-earned cash for a machine for *me* to use, let those hackers hack on their own machines...)

But, to try to answer the question, no, the 68000 doesn't support memory protection. It's not *impossible* to run multi-user, just unwise, unless you're very certain about the folks you allow to be users. And that just covers the "malicious intent" side of things, you still have to worry about runaway programs that accidentally romp thru memory and trash everything that everyone else was doing.

Rethink what you're trying to do. The ST is a *personal* computer. You don't want to have other people using it, you're supposed to have it all to yourself...

1894. GCR, Uniterm questions

Newsgroup: comp.sys.atari.st
Date: 1990-02-19 06:13:48 UTC
From: warningm@prism.cs.orst.edu
Message-ID: <15981@orstcs.CS.ORST.EDU>
Source record: 243331

Got a couple of questions that maybe somebody can help me with...

The first is on GCR. It won't let me do a reset. Is this normal? A couple of things is the manual implied that you should be able to do a reset, but it always gives me 2 bombs, and I have to power down to get back.

I just got Uniterm via ftp from someplace, and there's a couple of things I haven't been able to figure out. First, what is the name of the default setup file? It's annoying having to specifically load the setup file each time. How do you stop an autodail? Finally, when I try to do a view history buffer, it says that I don't have enough memory (I've got 2 megs...)

Thanks for any help...
Mike Warning

>that kind of thing? Can you still run TOS programs from inside it?
>Would you consider it useful to people who aren't real unix gurus?

I haven't seen it done, but someone posted here a while back about
getting TOS executable files to execute under Minix. It's probably
a doable thing, but not advertised as a standard feature of Minix.
Heck, you could kludge up a library that converted Beckemeyer's
RTX system calls to Minix calls, then you'd *really* have some fun.

Oh, other question - yeah, Minix is multi-user and multi-tasking.
Version 7 Unix.
>
>Also, along that same lines, what about Dave's Multitasking C-Shell?
>Can it do any of the aforementioned neato-keen stuff?
>
Dave's stuff can do multi-tasking for sure; I've played with Micro-RTX
a little bit now. I'm not really interested in trying to make my ST
into a multi-user box, and I don't have the MT C-Shell, so can't
answer whether it's multi-user or not. Don't see why not, tho.

>buffer, it says that I don't have enough memory (I've got 2 megs...)

The default setup file is called uniterm.set. You can usually use Ctrl-C
to stop an auto-dial. We have version 2.0e002 on terminator, I'd heard that
2.0e011 was available but no one has mentioned where to get it. Anything
prior to edit 005 has a bug in the redial code such that setting the retry
attempts to 0 really means 255. If you set it to 1, no problem.

You need to select the Buffer option in the help menu, and set the System
memory to at least (5? 10? I forgot) Kbytes before you're allowed to use
the history buffer.

1899. Uniterm metafiles

Newsgroup: comp.sys.atari.st
Date: 1990-02-19 08:08:11 UTC
From: WACKER@CERNVM.BITNET
Message-ID: <9002190807.AA24496@ucbvax.Berkeley.EDU>
Source record: 243347

A while ago I posted several questions about the metafiles (or, more general, output to VDI device) Uniterm produces when hitting Alt-F3. One of my problems was that I couldn't get direct output to the printer, it would always tell me 'unable to open VDI device'. Several people suggested that lack of system space might the problem. I never believed them, after all, I already had 600 kbytes system space. After I started thinking, however, I realized that the stupid Atari laser printer might need much more than that. Anyway, after increasing the system space to 1500 kbytes, I finally succedded to get direct output on the laser printer.

Actually, it works only most of the time, sometimes I get a page of blank paper or nothing at all. I haven't figured that one out yet.

It may be possible to decrease the 1500 kbytes a little bit. 1300 I know won't work, but I don't have it narrowed down more than that. Since Uniterm needs some 500 kbytes plus maybe a couple hundred kbytes buffer space plus you need GDOS and Diab630 plus maybe other AUTO programs and accessories you think you cannot do without, this whole thing won't work on anything less than a Mega ST4.

Now if the GEM file conversion programs some people told me about could be posted at panarthea (the only server I know how to access) or sent directly to me, I might be completely happy.

Cheers, Klaus.

>it moves at 250K bits/sec) but I am not sure it will work. I'd like to
>avoid using the internal expansion bus... any ideas?

Why wouldn't we use the RS-232 port for such speeds ? I know that this port is usually used at baud rates <= 19200, but if you read the specs of the 68901, you
see that it can be much faster : there's only a bit to change in a register, and
things go 16 times faster. The trouble is that the documentation states that such speeds should only be used for synchronous communications, and i don't think it is available on the ST. There seems to be no way of adressing the RS-232 port with the DMA (!).
Of course i did a few tests, and it seems to work allright. Maybe it caused some
damage to my hardware (i didn't notice anything yet !), but 57600 bit/s works fine. I did the test between my ST and a PC (incidentally, RS 232 ports on PCs can work at 115200 bit/s - there's a file exchange program using this speed). You can set up this speed with Rsconf, and even use bios buffers ! The maximum speed is 614400 bit/s : not so bad, isn't it ?

>countries (outside Canada and the US that is), please post it.

This raises the question how much fee I had to pay if I would
receive a cheque or money order from a foreign country (here:
anything outside Germany). Recently I got an Euro-Cheque from
Austria made out in DM (Deutsche Mark) and I had no additional
costs with it. Probably it is different with cheques from, say,
Canada or the United States. I shall try to find out and post
the results here.

Oh, and there is still the very cheap possibility to put some
banknotes into an envelope and hand it over to the snail mail
for delivery. Obviously this is not the most secure procedure
but for $15 (the Arcgsh Shareware fee I ask for) the risk may
be bearable.

I very much *doubt* that. And by whom? "Oh Mr. DA, I run a BBS full
of illegally copied software, and this guy planted a worm and
formatted my drive..."

Yeah, right. Actually, I would rather get some friends of mine, the
torpedo twins, Guido and Tony, to format their system.

That would probably be more effective, as pirates have backups of
software, but not many pirates have backups of their faces...

Yeah, I'd like to see some dweeb bithead who doesn't have a life
file a complaint against someone who "persuades" them not to post
copyright software.

MINIX is a 'clone' of UNIX (TM), V7. It can certainly do multitasking. On PC engines it also does multiuser processing. The ability is also there in MINIX ST but there may be a problem regarding the tty ports (i.e. serial ports). I haven't tried it yet, though. The newest version, namely 1.5.0, contains rs232 support and should therefore support multi users (2). This cannot be bought it must be built from the Version 1.1 sold by PH using the patches for PC and ST that were posted to the net.

You CANNOT run TOS programs. You can try to add such a feature analogous to the ability of running DOS programs in SCO Unix but it would be quite a project.

You should have UNIX knowledge. If you intend to do upgrading you should even be competent in UNIX and system programming. If you intend to do program development...

I would NOT consider it useful as a USERS OS. It's more a thing for people who want to know their way around in operating systems and like to have one os they can hack themselves (I haven't seen a spreadsheet for MINIX, for instance).

Hope this helps you.

< I've had trouble under TOS 1.4 with Toshiba disks as well -- double
<sided, MS-DOS, DOS 3.3, off a Toshiba 1200HB. One time I read a file into
<the ST, and got the 1st sector repeated for the length of the file. Many
<times directory changes (cd) fail or act weirdly. ...

< I've been told that Toshibas do something especially strange that
<makes things worse, but do not recall the details.

I've encountered similar problems with disks written in (supposedly)
IBM compatible format with Mtools on a UNIX-PC. One problem that I
have determined with Mtools is that it only writes the first copy of
the FAT. I've got plans to correct that short-coming and see if it
fixes the problem.
At any rate, could that be the problem with the Toshipa?

1910. Autostart for TOS1. and hard disk info required

Newsgroup: comp.sys.atari.st
Date: 1990-02-19 15:27:04 UTC
From: D.Wade@sysd.salford.ac.UK
Message-ID: <19.Feb.90.15
Source record: 243284

Thanks to all who pointed out that TOS1.6 will Autoboot programs from the INSTALL APPLICATION menu. I got a little side-tracked trying to get some disks built on an old STFM to work on my STE. They used Medium Res. and had an autostart program. By the time I had sorted out the Medium Res. problem my brain was a bit fuzzed. By the way for anyone with an STE there is a program on UK.AC.PDSOFT (PDSOFT.AC.UK for those outside the UK) which does a much neater job of fixing up the DESKTOP.INF files that the official ATARI fix To access via MAIL mail HELP to archive-server@PDSOFT.AC.UK. I can't try this from outside the UK but I think it should work.

Whilst I am on does any one know of a reasonable priced UK source of ASCI=>SSCI adaptor cards. The only one I have seen advertised was 100 Pounds Sterling which seems rather pricey when compared with some of the US prices quoted for example for the ICD adaptor.
(Or how hard is it to make your own ??).

Sorry no signature file but replies outside the UK may be sent to:-
D.WADE@D.SALF.AC.UK - Most Places, MS2@UKACRL - Bitnet.

[remarks about my remarks about forms handling ...]

You are right; I meant form_dial(). The application will not receive a WM_REDRAW message for handle 0 (desktop). For this reason I usually open a window which covers the entire desktop work area when I am "drawing directly on the desktop". Since there is only one window, and it doesn't have any sliders, movers, or other such nasty stuff, it isn't very difficult to deal with. The only way I can think of to intercept the desktop redraw is to create your own desktop object and declare it via wind_set(WF_NEWTOP, ...). I can't say that I have ever tried this, but I suspect that it would be more difficult than opening a big window.

From: covertr@force.UUCP
Message-ID: <48bd414d.14a1f@force.UUCP>
Source record: 243270

Roman@Tellabs discussed the issue of loading and printing GDOS fonts in a previous message. I would like to write a small GEM based program to print out a sample of each GDOS font loaded in memory. I want to print as many samples as can fit on a printed page, with the complete ASCII character set in each of the GDOS font sizes.

Does anyonealready have aprogram that does this?? I don't want to reinvent the wheel. If so please post here. Otherwise, I will post whatever code I develope myself. I am open to suggestions from any interested programmer.

> Canada or the United States. I shall try to find out and post
> the results here.

The expense comes on the sender's end.

A couple of years ago, on Rainer's recommendation, I bought the DRI Resource Editor from Merlin Computer GMBH, Eschborn, FRG. The price was 22.50 DM, which converted to about a third of the U.S. retail price of the Kuma resource editor, the only one available here at the time.

Merlin asked for a Eurocheque in Deutsche Marks. It cost me 12 dollars or so in service charges just to get a bank here to issue the check! And I had to wait almost an hour for this "service."

Since then I've found that you can buy International Reply Coupons, which can be converted into local stamps, at any post office. They're the optimum solution for most small exchanges.

(Actually, my wife and her mother routinely buy perfumes, tulip bulbs, etc., from companies in France and Holland that accept personal checks made out in U.S. currency. Those firms apparently have no trouble cashing the U.S. checks.)

Absolutely right -- although I think $15 is a rather steep tax on being too lazy to type the commands to ARC. :-)

Does anyone have any comparisons on small personal finance programs?
I would like to go for Phasar for the ST, but Quicken has received rave
reviews, and more importantly is half the price of Phasar. If I get
Quicken I would run it under PC-DITTO. (Interface isn't too bad
either. I think they are using the C-Worthy library).

Ok, time to add my 2 cents. I have never seen the Phantom typist as described on the net recently, but I *do* have problems when I have been using the mouse extensively (lots of movement for 2+ hours) in some programs - Michtron's Cards comes to mind first, but I can also lose it when reorganizing files. What happens is that the mouse and keyboard stop responding, the mouse pointer stops in mid move, then no mouse clicks or moves work and keys do not sound or show up on the screen (perhaps I don't wait long enough). A warm reboot cures the problem for a minute or so, then it shows up again. The real work around is to turn off my 1985 vintage 520 for a minute or two and then turn it on again.

It looks like a hardware problem - lost communication between IKBD and motherboard. Either the IKBD is a little sick, or the reciever uart is flakey (If I knew which was at fault, I'd fix it, unless it's a firmware problem). Is this related to the Phantom typist? If not, what is the fix if known?

Bob Pegram (Internet: pegram@griffin.uvm.edu)

P.S. I have Word Writer version 1, if the typist affects it, I will be looking for it. Does anyone know if the bug is version dependent in the programs it affects? If so, which versions? RBPIII

Hi netters,

I would like to have the folowing information from those
of you who are using a 9600 baud MNP5 modem with their Atari ST:

1. brand, model number and cost of your modem
2. problems encountered , if any
3. terminal emulation/ data transfer software which you use
and/or recommend
4. effective data rate achieved with
a) ascii files
b) binary files
c) compacted (arc'd or zoo'd) files
5. any other pertinent information.

If there is sufficient interest, I'l summarize and post it
on the net.

Thanks in advance.

>Can you tell me when you sent in your card so I can estimate when I might get
>mine? I waited until 10-15-89 to send mine in. AG is sending the PCD II out
>in the same order the cards were received.
>
>Thanks, lawrence

I sent my order in around September 2. A copy of my order form was packed with
my board and had a number 643 written on it. That probably was my number in
the queue for my order. (I don't remember the exact number but it was in the
mid-600's.) AG encountered problems of their boards not working on all STs
due to differences in timing between machines. They have a 2-chip fix for it,
and maybe they will install it on yours before they ship it. That could save
you some time.

I have a 520ST
with 1 meg and it was quite a job getting it to fit. I had to cut the center
post off the ST case so I could install it without interfering with the
keyboard electronics. It does fix but takes some creativity and determination
to find the right spot. If it works as well as PCditto I only faster, I will
be extremely happy.

>
>thanx
>
>Mark Johnson
>johnmar@iitvax

I have a small collection of math programs for the ST that I have used
extensively.

Ultragraph: from ST-Log, november something I think. Can plot/graph
algebra/trig functions in a bunch of different ways, in
two and three dimentions. Very nice graphics, not much
use in calculations, but very good for visuallizing stuff.

Matricks: Available from terminator, really comprehensive matric algebra
package.

Sub_Cal: PD form of El_Cal, written by J.A. Wrotniak (sp?), who writes
for Current Notes. Really nice program, I think it has the
capability you are looking for, and it only costs $4 from
the CN PD library.

All of these are some form of free, I encourage you to get them all. I could
probably come up with the exact issue of ST-Log for Ultragraph, if you like.

>
>Nick Cline
>cline@silver.ucs.indiana.edu
>

Nick,

The PC and the ST use the same basic file structure. You can take a 3.5" disk that was formatted and written on a PC and read it and write to it on an ST. The exception to the rule is, obviously, disks that have been formatted on a high density (1.44Meg) drive on the PC. The ST has 720K drives currently. Secondly, if you format a disk on the ST with a TOS earlier than 1.4, you will need to use a different format program other than the one that comes with the ST. The IBM looks for a particular boot block that, until TOS 1.4, the ST didn't write onto the disk. There are several ST programs that will format the disk with the IBM boot blocks in place, however, not the least of which is NeoDesk.

Hope that helps.

[Dan and a lot of other people talk about Piracy/Software Thieves and
User Groups. Dan complains about their user group being defamed because
it has the word Elite in the name.]

Dan,

Although I can sympathize with the "innocent until proven guilty" concept,
it's also a very difficult (read: impossible) task to redefine a term that
has been so closely associated with software theft for probably 10 years now.
There are many terms that people use as a cloak to cover up their real
meaning. The word "elite" is one that software thieves use. Unfortunately
for your user group, having that word in the name will probably forever
associate your group with software theft in the minds of people. I don't
know when or how your group was named, but it was not the best choice for
that reason alone. Perhaps the group once began as a theft group and has
since changed its ways, I don't know, but it's unlikely that as long as
it retains "Elite" in the name that people will not think of software theft.
Perhaps (and sadly) your group should consider a name change.

It's sad how often perfectly good words have been redefined into something
totally unrelated and often with negative connotations.

No. If you have a local Atari dealer or good bookstore, try them. We carry it in our store.

If you don't have a dealer, see if you can find a bookstore owned by real people and ask them to carry it. (This may not work if you're the only ST owner in a 100 mile radius, however. But, the good news is that you may find other ST owners who didn't know you were there...)

Source record: 243286

Keywords : ST World, "Stars" accessory, STE

Today I spoke (at last!) to Dave Stewart, editor of ST World, who told me that

"There are no plans to shut down ST World."

It seems that I was a little pessimistic, and I apologise if I got anyone worried. I didn't actually say that ST World was going to disappear, just that it looked as if it would. However, it appears that ST World will continue to be published and there will be a small item in the next issue explaining what the current ownership situation is.

Next month's issue (March) _should_ also see the start of a series on programming the STE (but don't hold your breath...)

To all those who have mailed me asking for a copy of my 'Stars' screen blanker, I've had a technical hitch with the ST to VAX link, and am now in the process of getting a copy of uuencode for the ST (Thankyou Pete Fenlon). I should be able to mail you all the uuencoded archive later this week.

Similarly with STE documentation - I'll post it when I've managed to type it all in and got it across to this VAX.

Regards,

Mathew Lodge

1928. GEM

Newsgroup: comp.sys.atari.st
Date: 1990-02-19 20:08:14 UTC
From: ramsiri@blake.acs.washington.edu
Message-ID: <5838@blake.acs.washington.edu>
Source record: 243265

What is the status of GEM?

It would be nice if we had a clipboard a la mac and
some standards in data format that would facilitate
easy importing and exporting of data between programs.
I think this is one of the virtues of the mac OS/Finder.
THe above allows for a much more integrated environment
that tends to foster greater productivity.

Another very nice data structure a la mac is the
data fork/creator fork concept. The GEM "install application"
is gross in comparison. For those who don't know
what i am talking about: when an application produces
a document under the mac os, that document has a
"creator" attached to it. Now, whenever you click
on that document no matter where it is in any folder
or in any partition, the application loads and
loads the document with it. System 7 purportedly
takes this further. Let's say you cut a part of
your Excel spreadsheet and paste it into your word
processor document. At some date later, you go back
into Excel and update your data. The pasted part that
has been sitting in your word processor document gets
updated automatically.

Also.. most mac programs will load foreign documents.
Translate them into their own format etc...

I much prefer the ST hardware over the mac's with the same processor.
The ST with TurboST and NeoDesk has a much faster redraw...
also... the ST's I/O speed is considerably noticeable.
I even prefer most of the ST programs over their comparable mac
applications. But the general environment of the ST is
clunky. How difficult would it be to change TOS/GEM to
provide us with some of the features listed above?

Since i don't log onto Genie, i don't know if these issues
are being discussed at the Roundtables. If so, anybody
care to elaborate HERE?

Considering the TT (the what?) is based on a much more
powerful processor, will GEM be rewritten to take advantage
of it? I don't want just a "faster" ST...

-kevin
ramsiri@blake.acs.washington.edu

BTW: I hope people don't take this as a flame... or say
"go buy a mac ", for one: these are suggestions
(that i am sure are not novel), and two: i use
GCR, so i get a feel for the differences between
the environments rather immediately.

Oh dear - here at Edinburgh Uni we have an ATW with a Mega 2 front-end!
Does that mean we're out of date?

> for users.

Yeah, docs are a bit of a bummer but if you buy a decent C compiler they
usually come with ST documentation. Prospero C has over 1000 pages,
split into 4 books, one on ANSI C libraries, one on the language and the
other two cover the AES and VDI in detail (however, they seem to have
been nicked from the IBM GEM documentation). The Concise Atari ST
Programmer's Reference by Katherine Peel is a good reference on all
aspects of the ST. There are NO technical manuals supplied with UK Amy
500's the docs cost about 30 quid a book and there's about 4 books. At
least they're available though.

>
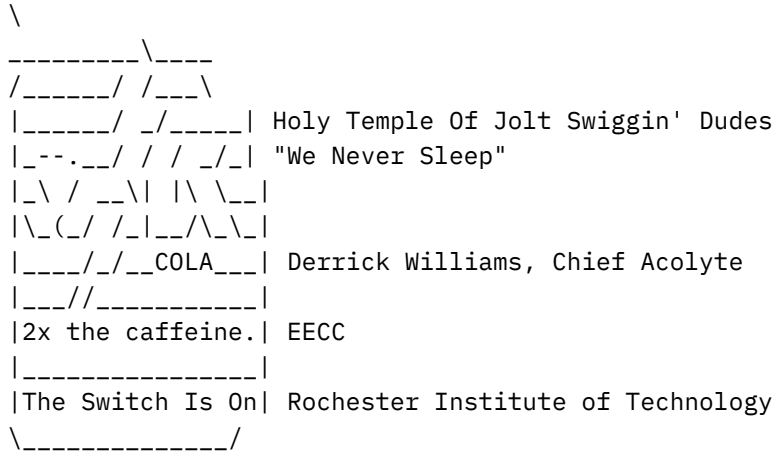
> Robert Gambs (S54394GR@ETSUACAD.BITNET)

One I know that puts a picture in the background in all three resolutions
is Video Easel. I have had the demo version for about a year. I thought it
was neat, so I went to look for the commercial version. However, my local
dealer stopped carrying it a long time ago, and software mail order places
don't seem to have it. But the pictures that came with the demo version
(you are stuck with the ones it comes with, but in the commercial version
you can choose your own) are ok. It cost $16, which made it sort of a frivolous
purchase, since that's all it did.
Anybody know what happened to this program? Is it pd or shareware now?
Anybody want to sell their copy?

Derrick



1932. Uniterm Fonts

From: dhe@uafhcx.uucp
Message-ID: <3732@uafhp.uark.edu>
Source record: 243273

Does anyone out there know the format of the 'uft' font files for Uniterm 2.0e? The readme file states that they are supposed to be just the data part of a GEM font file, and of course, I have no information on that either. I'd like to load a IBM font so that I can use Uniterm with our local IBM BBS's that use those extended characters. Thank you for anything anyone can send me.

1933. Portfolio info needed urgently

Newsgroup: comp.sys.atari.st
Date: 1990-02-19 23:55:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <90Feb19.185728est.58293@ugw.utcs.utoronto.ca>
Source record: 243289

A local entrepeneur is in the midst of preparing a commercial proposal and he is looking at the Portfolio (because of its size) as the smart controller for the system. The developer wants to do some bi-directional I/O and to display data graphically (line plots).

What he needs to know is:

1. Are any languages available for the Portfolio? Would some off-the-shelf PC BASIC work, for example.

2. Are the ROM routines documented anywhere (such as pixel on/off, line primitives, RS config, etc.)

If he can get a language that access ROM routines to do the I/O and graphics, he can use the Portfolio as a small instrument controller.

He has to prepare an interim proposal within the next few days. If anyone on the net has info, please E-mail to me and I will pass it along.

PS. what about alternatives to the Portfolio (remember, compactness is essential).

| Todd Miller - millert@tramp.Colorado.EDU |

Those *.Z files have been compressed with the UNIX "compress" utility.
You need the "uncompress" utility to decode them. As far as I know, neither
compress nor uncompress has been ported to the ST, you'll have to do this on
a UNIX machine.

>but I would prefer to write and compile my code on a Sun, then transfer
>the binaries over to my ST later.
>
>How difficult would this be? Will the package compile normally on the
>standard Sun C compiler? Any help would be appreciated.

This is easy to do, trivial in fact. But, you better have a lot of
disk space. The first step is to build the standard Sun version of
gcc, then use that to build the cross-compiler version. (Just takes
editing a few config files to select which version to build.) Once
you have the cross-compile built, you can compile the TOS C library
on the Sun as well, tho you don't need to (the binary is usually
already included). Then, just compile and link - you get TOS executables
with no sweat at all. Transfer to ST and run.

Hey - y'know, there's a Unix program distributed with Minix that
simulates a PC. How hard could it be to put together a TOS simulator
to run on, say, a Sun or NeXT box...(or Atari TT, for that matter!)??

a quick way to get printed music into electronic form. Any ideas?
--
-- Howard Chu @ University of Michigan

I was at an Amiga conference last year, and remember talking to a
scanner company about exactly that. They asked me if I thought it
was a good idea, because one of their developers had thought of it. I
thought, gee, that would be nifty. Then, I thought...

Well, this would really come in handy for loading preprinted scores
into MIDI files for editing. However -- how many of those do I have?
Answer: not many. I've got lots of fake-book type lead sheets, and
lots of hand-written music, but not too much preprinted stuff. I
think that the software would *not* be able to do handwritten stuff,
because of the obvious problems. (OCR software can't handle
handwriting very well either.) Without that ability, it would be
nearly useless for me, and I thought for lots of others.

In short: I think that there is not such a package availble.

Sorry if I caused the early death of such a project ;-)

1945. Floptical Drive Failure... Last update

Newsgroup: comp.sys.atari.st
Date: 1990-02-20 07:55:45 UTC
From: unknown@ucscb.UCSC.EDU
Message-ID: <6790@ucdavis.ucdavis.edu>
Source record: 243285
Cross-posted to: comp.sys.apple,comp.sys.mac,comp.sys.ibm.pc,comp.sys.amiga,comp.sys.atari.st

Well, I told people that requested information from me regarding the Floptical (R) drive that it was not a done deal in getting them for group rates. In fact, I hopefully implied that it was probably more likely that they wouldn't let us do it.

Alas, today I got the letter from Insite saying that they wouldn't go along with the deal.

At least, in my opinion, they were nicer about it than Brier was. I will type in the letter at the end of this message in case anyone's interested in what they said.

I have actually heard more about the cartridge drives recently [based on Syquest drives], and I believe that they will work properly with the 'built in' SCSI drivers included with GS/OS (to the people on other newsgroups: that's the system software for the Apple IIGS).

I thank all of those who expressed interest in getting these drives at a 'group rate'.. Since I have no need for all of your names and mail addresses, I will delete them sometime soon when I get around to it.

__The text of the letter follows:__

I do not think it would be a good idea for Insite to sell to you and your 99 friends on a direct basis. The reason is that you have raised a number of questions (ie Power Supply issue) and assumptions (software drivers) that will present legitimate problems for your [sic -tuu] in the integration of our FLOPTICAL (R) drive into your computer. Because Insite does not specialize in dealing with these types of issues (specifically software drivers) it would be detrimental to both parties to try to establish a business relationship based on a foundation that we are not experienced in.

Insite appreciates your interest in our FLOPTICAL drives and we will fully understand if you elect to not wait for our distribution network to become established (December 1990) and purchase an alternate product. Best of luck.

__ end of letter__

Brier, the other company making a similar product, seemed to be much more rude in their letter. Not rude really, that's too strong.. Brier's letter just sort of hit me as "We already said we won't deal with the public, so just get off our back"..

hmm.. even though I -KNOW- I have software drivers that will work [or at the very least I know people who will MAKE them work] they still won't sell to us. And making/buying a power supply wouldn't be that difficult.

Once again, thanks for the interest, and I hope I didn't get too many people's hopes up falsely. Both companies say their products are either out (as far as my memory goes, Brier said Dec 1989) or will be out this year in the case of Insite... I think in the $800 range will be what the final product will cost, so I guess it's in the league of cargridge drives....

Hello all,

I can't believe that so far there has not been a single reply to the recent announcement that the Info-Atari16 digests will be discontinued.

This will mean that the BITNET/EARN Atari users will lose their link to the rest of the Atari world. (And you others will lose their participation in ST discussions).

But no, that blasted piracy discussion (runner-up is the Phantom typist one) happily continues, people are posting huge signatures with two-line messages, others post in triplicate, and the digests are discontinued due to TOO MUCH NET TRAFFIC!!!

Why is it that the real work is always left to a few people like Ravi et al? Yes, I'd volunteer, but I'm only on a BITNET end node, so I can't do anything.

Or am I missing something?? Flame away.

>read the other's disks? Thanks,

The disk formats are compatible-ish. You must, of course, have compatible physical media on both machines. Normally, this means that your ST must have a double-sided (3.5 inch) drive -- PC 3.5 inch drives are all double-sided.

For ANY version of TOS you can then transfer files by swapping disks between the two machines, if you follow two rules. First, the disk MUST be formatted on the IBM PC; ST's are happy with PC-formatted disks, but PC's don't like standard (desktop-formatted) ST disks. (If your PC has a Quad (or High) Density drive -- 1.4 Meg -- you must make sure you format in 'normal' density mode.) Second, you must not use subdirectories. Put all the files on the top level of the disk (the root), not in folders. (Folders sometimes work and sometimes not when interchanging. Best to avoid them.)

For some of the later versions of TOS these restrictions are not necessary and you can simply swap disks with no problem. Also, some public domain formatters on the ST will format a disk so that a PC will accept it. However, if you heed these restrictions, you don't have to worry about your TOS level, and you can do the swap using only standard parts.

>buffer, it says that I don't have enough memory (I've got 2 megs...)

Default setup file is UNITERM.SET. (Default phone number file is
UNITERM.TEL.) For stopping autodial, note that in some versions of
Uniterm the 'retry count' set in the phone-number list is actually a
'try' count, and 0 means try forever. If it is hanging, try setting
retries to 1. To forcibly stop an autodial, use control-C. Far as
buffers go, one of the things saved in your setup is your buffer
sizes. Uniterm allots your memory to buffer uses *statically* when you
start it up. Check the BUFFERS sub-menu in the SETTINGS menu to see
how much space you have alloted for history. Adjust to taste, and
save.

1950. Re: SID trio sound digitizer

Newsgroup: comp.sys.atari.st
Date: 1990-02-20 10:40:05 UTC
From: dillenbu@uicbert.eecs.uic.edu
Message-ID: <63300008@uicbert.eecs.uic.edu>
Source record: 243297

As a matter of fact I designed a sound digitizer for a school project
on my ST. I designed the circuit (very simple actually, just a A/D converter
and an amplifier) and implemented it on a Douglas prototype board. I
used wire wrapping and the toal cost for making it was under $30. However,
the A/D converter I used would be very difficult to obtain. I got mine
by asking for a sample to be sent out for "an Engineering Project" I was
involved in. I also wrote software that can sample the converter at up to
64 kHz (it might even go higher but I haven't tried). The software is GEM
based and allows you to play/edit a number of digitized sounds at once.
If you are interested, I might be cajoled into making it public domain
I also have a LaTeX document with my final report on my project's status, I
would certianly be willing to send this out to those interested. (Figures
not included, I drew most be hand.)

pjj@r2.uucp (Pete Jinks) writes:

>1) Although formatting sometimes detects faults, why doesn't it always do so ?
> Is it because I need to use several different test patterns (slow) ?

The DESKTOP formatter checks for format errors and maps them out in the FAT.
It does this by verifying the contents of the sector in memory and on disk.
This test, however, is not perfect. You might use several test patterns to
improve this.

>2) Does such a program exist already ?
> If not, would people like a copy if & when I get it working ?

I have written a few programs that do parts of the job. They were published
on the disk that belongs to my book SCHEIBENKLEISTER, a floppy and hard disk
book. Some months ago, I started writing something like you want to write
now, but never completed it. If you have a version ready, I would lllove
to get one.

>3) To speed things up, I am trying to access a track at a time. With 2-sided,
> 9 sector per track discs, rwabs will not let me read 18 sectors, but will
> let me read 9 - is this as expected ?

RWABS works perfectly when being asked for 18 sectors. No problem. Are you
sure you have set all the parameters correctly?

>4) I would also like to reposition the read/write head over the next track
> while I am checking the previous track - how can I do this ?
> Are there any other ways to speed things up ?

You will have to delve into direct FDC programming for doing this. Learn
German and read my book 8-) 8-)

>5) I suspect that TOS will automatically check the sector(s) written to disc
> for me - is this so ? how can I turn it on (or check that it is on) if it
> is optional ?

TOS automatically verifies what you're writing on disk if the verify flag
at $444 (system variables area) is set.

>6) Like an idiot, as I was using C for the first time, I accessed drive '0'
> instead of drive 0 (i.e. 0x30 instead of 0x00) and got to my hard disc.
> Which partition did this access ? I think that I corrupted a sector & want
> to get the right replacement from backup.
> Which hard drives can be write protected ?
> Is there software available which will "write protect" my hard drive ?
> (I don't mean virus-proof it)

Accessing partition 0x30 should fail and give you a RWABS error (unknown drive). At least, I think it should do so. Will reconsider that one.

There are some hard drives that can be write-protected by hardware. There are also many software solutions for this problem; one of those is my hard disk driver (included in the book mentioned above) that write protects hard disk partitions.

>7) I have been offered a formatter that will give 11 sectors per track. Could
> anyone with experience of using discs with 10 or 11 sectors per track
> comment ?
>
Try 11 sectors, and if your drive doesn't moan, it won't do ever. If you have a drive that spins too fast 11 sector formatting will fail because there's not enough space on the track.

10 sector formatting is perfectly safe and highly recommended.

>directory sectors on the disk.

I've written the first German 11 sector formatter called HYPERFORMAT and
have more than two years of experience with this program and with the
whole problem. The problems you're describing are very typical for
boot sector viruses! 10 sector disks are perfectly safe. 11 sector disks
might introduce some difficulties if you own a drive that spins too fast.
This can be cured by adjusting the rotation speed internally.

>Another thing: I remember reading in an old copy of the developer docs or
>the abacus disk book (sorry can't remember which, I don't have it here)
>about the minimum space needed for the control information (required for
>each sector) and the acutal available space per track, and concluding that
>11 sectors is impossible: it won't fit (?!?), and 10 is very tight.

The Abacus disk book tells you a lot of stories, and we had a lot of
fun with it laughing all night... 10 sectors aren't tight. 11 sectors
are, but it works if you have a drive that spins at the correct speed.

BTW: We have expanded disk capacity up to 14 sectors per track (needs
a little hardware hack), and it works fairly safe. We even have connected
1.44 MB HD disk drives to standard STs (again, with a tiny hardware hack),
and now we're pushing those disks to 21 sectors per track. Ain't that nice?

I have a really simple question here:

Where might I obtain G-Dos?

Is it commercial? Pd? What? They dont seem to sell it at any of the
stores around here.

Thanks,

Frank

1956. Which? (Was: ST World)

Newsgroup: comp.sys.atari.st
Date: 1990-02-20 14:01:41 UTC
From: ljdickey@water.waterloo.edu
Message-ID: <3007@water.waterloo.edu>
Source record: 243293

There has been some talk lately about ST World. Writers, please
be careful about identifying which publication you have in mind.

One magazine is
ST WORLD
(ISSN # 088-1057)
2463 Latona Court NE
Salem OR
USA 97303

and the other is
ST World Magazine
(no ISSN # ?)
Gollner Publishing Ltd
10 Theatre Lane
Chichester, West Sussex
UK PO19 1SR

My recollection is that "ST World Magazine" changed its name from
"ST User" to "ST World" to avoid confusion with another magazine,
which I now presume to be "Atari ST User". I suspect that
Mr. Hugh Gollner was informed about the existence of "ST WORLD",
and changed the name from "ST World" to "ST World Magazine".
The name "ST World Magazine" appears at the bottom of each page
but not in the masthead. In fact there is no name of a magazine
in the masthead! There is a small "TM" near the name "ST World"
on the cover, but I hve not seen it inside the magazine. Amusing.

1957. Info atari-16 DIgest

Newsgroup: comp.sys.atari.st
Date: 1990-02-20 14:11:00 UTC
From: FRACHEL@UMIAMI.MIAMI.EDU
Message-ID: <9002210804.AA03687@ucbvax.Berkeley.EDU>
Source record: 243294

If the info-atari16 digests are being discontinued, will I still
be able to post messages to the net? I cannot post directly to
it, so I have to send my messages to info-atari16@wsmr-simtel20.army.mil
which in return sends them to the net.

Concerned,

Frank Rachel

1958. Re: MicroEMACS 3.10 -- thanks

Newsgroup: comp.sys.atari.st
Date: 1990-02-20 14:54:17 UTC
From: markr@seqp4.ORG
Message-ID: <338@seqp4.UUCP>
Source record: 243299

Yes, 3.10 as distributed CANNOT SHELL OUT. Part of the
problem is that it attempts to use MWC library routines
without being "in" a MWC shell environment. The other part
is that there is no attempt to clean up GEM and the mouse
handlers before shelling out.

I have resolved most of this by reworking "atari.c" and "st520.c",
(i-shell works, filters and pipes are broken.)

I am planning on integrating 3.10 with micro-rtx and your favorite
shell to provide a shell co-process. If this takes too long I might
be convinced to post the repaired source files to allow at least
i-shell functions.

I agree that some of the 'discussions' are not very worthwhile,
though I would think that the one related to the 'PHANTOM TYPIST' isn't
too out of line. It may help to find out the culprit and get it fixed.

> Why is it that the real work is always left to a few people like Ravi et al?
> Yes, I'd volunteer, but I'm only on a BITNET end node, so I can't do anything.
>
> Or am I missing something?? Flame away.
>

You may indeed be missing something <no flame intended>. I've been
quietly bothering my System Administrator to finish our Internet link so
that our site can be the host for INFO-ATARI16. Ravi (et al) have been
informed of my efforts, and have expressed hope that within a few weeks
the move can be accomplished.

I apologize to Ravi, etc. if my response to this is somewhat
premature. I hadn't said anything about this before because I thought
it would be imprudent to raise everyone's hopes while everything was
still a bit 'iffy'. However, I felt the need to respond to Volker's
post. My apologies to anyone who might be offended.

There are quite a large number of sound files available in the Macintosh archives. You'd need a Macintosh with BINHEX and, probably, UNSIT to convert them to binary form. I did this with several of the files using a program which appeared in STart a while back.

The Macintosh archives are on sumex-aim.stanford.edu [36.44.0.6]

>the monitor on their equipment. I assume the monitor is dead and not something
>on the computer. But I don't know. If anyone with some documentation (what
>is documentation on an ST???) can come up with a clue, please let me know!!!

The SM 124 appears to be very sensitive to sudden power surges such as the one
induced by turning your modem off and on. The culprit is generally a small
2 amp fuse located on the base of the board near where the wireing for the
speaker attaches to the monitor board. I have had this fuse blow 6 times
over the last 4 years on my early SM124. I suggest replacing the fuse with
a slow-blo type 2 amp, this seems to make them last longer. You will have to
remove the monitor case to replace the fuse and as with all high voltage
equipment, if you don't know what your doing ask a friend who does. At the
very least trying a .20 cent fuse beats an expensive service call.

I hope this helps,

>Also, does the MT C-shell come with any Unix utilities and, if so, which
>ones? What do people think of it? Is it just as good to get a public
>domain, multi-tasking kernal such as MX2?

Dave wrote a multi-tasking kernel (Micro RTX) which is what he bases
his stuff on. Micro RTX is available as shareware here on the net.
His stuff does indeed support multi-user multi-tasking (I'm running
his stuff on my system at home), although you do come to appreciate
the limitations of an 8-mhz 68000. (Hmmmm...I need some more processor
horsepower here!). His UUCP stuff works, too (I have my own UUCP
site setup and can recieve mail, and everything! :-). If you want
to get a flavor of his stuff, get his single tasking C-shell and
tools; I've been using them for more than 5 years now, and have
nothing but good things to say about them.

Highly recommended.
Note: I'm not connected with BDT in any commercial way, although I
do know Dave.

1968. v10INF1: Introduction to comp.binaries.atari.st

Newsgroup: comp.sys.atari.st
Date: 1990-02-20 18:24:17 UTC
From: koreth@panarthea.ebay.sun.com
Message-ID: <14927@newstop.EBay.Sun.COM>
Source record: 243212
Cross-posted to: comp.binaries.atari.st,comp.sys.atari.st

```
Submitted-by: koreth@panarthea.ebay.sun.com (Steven Grimm)
Posting-number: Volume 10, Info 1
Archive-name: intro

This is the first of three introductory articles about comp.binaries.atari.st.
This one describes how to submit binaries to the newsgroup. A companion
article lists all previously-published binaries, and a third article explains
how to retrieve and unpack binaries posted by others.

I am always looking for suggestions on how to improve the usefulness
of the newsgroup, and can be contacted as listed below.

-- Steven Grimm
koreth@panarthea.ebay.sun.com

--------------------

Subject: Submitting binaries for publication

Items intended for posting or queries and problem notes should be sent to
atari-binaries@panarthea.ebay.sun.com. If you are on a UUCP-only site, you
can send them to {backbone}!sun!ebay!panarthea!atari-binaries.

If you're in Europe, you can send binaries to the European submoderator,
Jan-Hinrich Fessel, at unido!atari-binaries (or, if you're a masochist,
atari-binaries@unido.informatik.uni-dortmund.de.) He will test them and
forward them to me. Submitting to him saves net bandwidth, so it's
encouraged.

If you want verification of arrival, so say in a cover note, or at the
beginning of your submission, if it is small. I try to verify that a
program works, and if I can't get it to work, I may hold up posting it
for a couple of days. Please note that, except in rare cases, software
without documentation will not be published. The backlog from receipt
to posting varies from one to four weeks depending mostly on the set
of submissions currently in my queue.

If you are submitting both sources and binaries, PLEASE send the two
separately. If I have to separate your sources from your binaries by
hand, your submission will most likely sit on the back burner for a
while.

Also, as of volume 8, I will only accept binaries packed with an archiver
for which source code is widely available. For the time being, this pretty
much means arc, zoo, and lharc. If you want to use a nifty new archiver,
make the source code available to the public (posting to comp.sources.atari.st
```

is fine.)

Subject: The structure of comp.binaries.atari.st articles

Each posting in comp.binaries.atari.st is called an "issue"; there are roughly 100 issues to a volume. The division is arbitrary and may vary. There are two types of articles in comp.binaries.atari.st: binaries and "information postings." They can be distinguished by the subject line:

Subject: v10INF2: Index and other info

This first word in the title identifies this as the third info posting of volume six. Similarly, the subject line shown below:

Subject: v10i081: ibmboom -- Detonate IBM clones over the network

identifies this as the 81st binary article in Volume 10. Large programs are broken up into smaller pieces, and have subject lines that look like this:

Subject: v10i041: slowmand -- The world's slowest fractal system part04/30

Certain information about the system configuration required to use the program is given on the keywords line.

Keywords: uuencode, 1meg, medium, high

This means that the program requires at least one meg of RAM and runs in medium or high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self-explanatory.

uuencode - program is uuencoded (UNIX uudecode required to unpack)
uue - program is uuencoded (ST uud required to unpack)
arc - program is archived (arc required to unpack)
zoo - program is a zoo archive (zoo required to unpack)
lharc - program is an lharc archive (lharc required to unpack)
high - high resolution
medium - medium resolution
low - low resolution
1meg - needs 1 meg of RAM

The first few lines of an article are auxiliary headers that look like this:

Submitted-by: jackt@atari.UUCP (Jack Tramiel)
Posting-number: Volume 10, Issue 80
Archive-name: free

The "Submitted by" is the author of the program. If you have comments about the binaries published in comp.binaries.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site.

The "Reply-To:" header line in the article's main header points to the submitter, to make commenting about binaries easier.

The second line repeats the volume/issue information for the aide of notes sites and automatic archiving programs.

The Archive-name is the "official" name of this program in the archive. Large postings will have names that look like this:

Archive-name: desktop/part01

Since most archive sites run UNIX, articles are given UNIX-style filenames rather than ST-style filenames. I do make an effort to keep filenames to 8 characters or smaller, however.

Subject: Reporting and tracking bugs and patches to postings

Updates to programs are usually announced in comp.sys.atari.st. When large changes are made to a program, the entire thing will be reposted to comp.binaries.atari.st.

To report bugs, contact the person listed in the Submitted-to header. Often there is a contact address in a README file, too. I do not maintain the programs I moderate, so don't send your bug reports to me.

If the program documentation mentions some file that isn't included in the posting (for instance, a font editor's documentation might refer to some sample fonts), contact the submitter, not me. I post articles in their entirety, so if it isn't posted, I probably don't have it.

1969. Re: Discontinuation of Info-Atari16 digests

1970. v10INF2: Index of previously-published binaries

Newsgroup: comp.sys.atari.st
Date: 1990-02-20 18:27:16 UTC
From: koreth@panarthea.ebay.sun.com
Message-ID: <14929@newstop.EBay.Sun.COM>
Source record: 243213
Cross-posted to: comp.binaries.atari.st,comp.sys.atari.st

```
Submitted-by: koreth@panarthea.ebay.sun.com (Steven Grimm)
Posting-number: Volume 10, Info 2
Archive-name: Index

Note: When requesting files from the archive server, replace the last "/" in
a file's path with a space, i.e. volume1/turtle part01. You may request
several files from the same directory (volume1/turtle part01 part02 part03).

1971. v10INF3: Unpacking binaries (and retrieving old ones)

Newsgroup: comp.sys.atari.st
Date: 1990-02-20 18:31:44 UTC
From: koreth@panarthea.ebay.sun.com
Message-ID: <14932@newstop.EBay.Sun.COM>
Source record: 243214
Cross-posted to: comp.binaries.atari.st,comp.sys.atari.st

Archive-name: unpack.cooked

HOW TO USE COMP.BINARIES.ATARI.ST

by Steven Grimm

Last update: February 20, 1990

A preliminary note, for those of you who know most of the
below already: the official archives on panarthea are NOT
reachable via anonymous ftp from the Internet. Read on for
information about accessing them by mail, or see the table
at the end of this document for a list of alternate archive
sites.

_1. _W_h_a_t _a_r_e _b_i_n_a_r_i_e_s?

Binaries are files that contain information other than
normal text. Usually, a binary that is posted to the net
will contain executable (program) files. Binaries are dis-
tinct from _s_o_u_r_c_e_s, which are the human-readable text files
that are interpreted by a computer and used to produce
binaries. Sources can be modified with relatively little
effort, and are usually pretty easy to read. Binaries are
not intended to be viewed by a human.

_1._1. _U_u_e_n_c_o_d_i_n_g

The programs which transfer network news messages (and
electronic mail) are not always capable of handling a pure
binary file. They are designed to handle textual messages,
and the odd symbols and characters in a binary cause them to
become confused, and often to mangle the binaries. To avoid
this problem, a method called _u_u_e_n_c_o_d_i_n_g is used. Uuencod-
ing translates a binary file into text characters, so that
the news and mail transport programs won't mess up. The
disadvantages are that uuencoded files are about 30% bigger
than the raw binary files they represent, and that you have
to go through one extra step to get the binaries to work on
your computer.

_1._2. _A_r_c_h_i_v_e_s _o_r "_a_r_c _f_i_l_e_s"

Usually, a program will need more than one file to work properly. The extra files might be data files, help files, or maybe some instructions for the user. In order to easily package multiple files together in one binary file, a program called "arc" (short for "archiver") is used. Arc also compresses all the files as it packages them, so that the arcfile take up less disk space (and takes less time to download!) than it would if its contents were just thrown

together.

To confuse matters even more, two new archive programs called "zoo" and "lharc" can also be used to achieve the same effect. Zoo is superior to arc in some respects, slightly inferior in others, as is lharc. Unfortunately, you can't unpack a zoo archive with arc or lharc, or vice versa (arc and lharc are similarly incompatible with each other.)

_1._3. _U_S_E_N_E_T _a_r_t_i_c_l_e_s

The USENET has groups designed especially for transmission of binary files. They are usually called something like "comp.binaries.x," where x is the type of machine that the programs will run on. For Atari ST owners, the group to watch is comp.binaries.atari.st. Most of the binaries groups (including the Atari binaries group) are _m_o_d_e_r_a_t_e_d, which means that you can't send a program directly to everyone on the network. Instead, you send it to someone in charge of the group (the _m_o_d_e_r_a_t_o_r), who makes sure that your program works and contains the proper documentation (or that the lack of documentation is announced), and that it's in the correct format to be sent out to the rest of the USENET.

One of the restrictions of the USENET is that articles can only be a certain length. If a binary is longer than that, it must be split up into several parts, each no longer than 45000 bytes or so. This introduces yet another obstacle to people who want to transform the articles into a useful form, but it can't really be helped until the USENET starts running much more advanced news transmission software. Also, some particularly long programs may be posted over the course of several days; otherwise the net would be overloaded with lots of huge messages, and people would complain.

USENET binaries are grouped into _v_o_l_u_m_e_s, each containing about 100 articles. This is to make life easier for people who are trying to keep track of which articles have been posted. When a new volume is started, the moderator

will usually post introductory articles, including a list of previously published articles.

_2. _H_o_w _d_o _I _g_e_t _b_i_n_a_r_i_e_s?

There are two ways to get binaries: first, by reading the USENET newsgroup comp.binaries.atari.st; you will see new articles within a week (usually much less) of the time they were sent out by the moderator. If, for some reason, your site doesn't receive comp.binaries.atari.st, or if you want to look through previously posted articles, site panarthea.ebay.sun.com has all the binaries stored in its

archives.

The other way to get binaries is to request them from panarthea's archive server. The archive server is a program that intercepts incoming mail messages and looks for commands inside them. You can tell it to list the available binaries, give you help, or send whichever files you're interested in. The requested files will be mailed to you. One thing to be careful of is that multi-part postings aren't placed in the archives until all their parts have been sent out to the USENET at large. This is to prevent people from requesting all 99 parts of a program the first day it appears, thus overloading the net and defeating the purpose of piece-by-piece posting.

To find out more about the archive server, send a mail message containing the word "help" to archive-server@panarthea.ebay.sun.com. Talk to an administrator at your site if that mail address doesn't work. If you don't get any response from the archive server within a few days, something may be wrong; mail archive-manager@panarthea.ebay.sun.com to report the problem.

There are other archive sites, too, such as terminator.cc.umich.edu; they contain most of the comp.binaries.atari.st software as well as some additional programs that have not appeared on the newsgroup. Some sites, such as terminator, also offer something called "anonymous ftp" if you're on the Internet. Say "ftp terminator.cc.umich.edu", and if you connect, use "anonymous" for a username, and your username for a password. See the ftp documentation at your site for more information. A recent, but possibly incorrect, list of alternate archive sites appears at the end of this article. Please send me mail if you know of any that aren't mentioned here, or if my list is incorrect. Note that panarthea does not offer anonymous ftp, as it's on a network that's segre-

gated from the Internet.

Panarthea also offers an "auto-index" service, for people who don't have access to the USENET groups. If you request autoindex service, you will receive copies of the archive-server's index files for the binaries and sources groups whenever new files are added. Note that if your site gets comp.binaries.atari.st, requesting autoindex is pointless and a waste of net bandwidth. Send mail to autoindex-request@panarthea.ebay.sun.com if you'd like to sign up.

_3. _H_o_w _d_o _I _d_e_c_o_d_e _t_h_e _b_i_n_a_r_i_e_s?

As stated above, turning binaries from USENET articles into a more useful form can be a multi-step process. At the least, you will need the uudecode program; it is standard software on most UNIX|- systems and is available in a couple

_____
|- UNIX is a trademark of Bell Laboratories.

of forms on the Atari. Versions for other operating systems do exist, and can certainly be written with little effort. Arc is available for UNIX and other operating systems, but is not standard software. In any case, you will want at least arc on your Atari.

A version of uudecode written in ST BASIC is available in panarthea's archives (see above). It is in volume 1 of the comp.sources.atari.st directory (note that that's _s_o_u_r_c_e_s and not binaries). Once you have that, you should get the files "arc," "arcdoc," and "uucode" from volume 1 of the binaries directory. They contain the arc program mentioned earlier, its documentation, and a much better, faster version of the uudecode program.

Use the BASIC program to uudecode the two encoded files; then use arc to unpack the better version of uudecode. (Arc is documented in "arcdoc.") Note that if you're reading news/receiving mail on a computer (such as a UNIX system) that already has uudecode, you can skip most of this; you will probably just want to uudecode arc there, then download it (using kermit, xmodem, or your favorite transfer protocol - consult your site's administrator and your Atari communication package's documentation for more information. Remember to use binary mode when downloading arc files!)

So far, everything has been small enough to fit in one piece, but you will almost certainly want to try something larger eventually. The Atari "uud" program (whose source code, also suitable for compilation on UNIX systems, is

available in the sources archive) is capable of easily decoding multi-part uuencoded files. Near the top of each part (except the first) will be a line like

begin part c foobar.uac

Rename each file (except part 1, which can be named "part01" or just about anything else) to the name at the end of this "begin" line, in this case "foobar.uac". Then run uud on the file containing part 1; it contains instructions to cause uud to look for the other parts. If you have a text editor or a UNIX style cat program, you can just stick all the parts together in order and run uud on the resulting (big) file; it will try to go on in the first file if it can't find the next part in a separate file. Note that uud won't warn you if it's overwriting an existing file, so don't give any of the parts the same name as the file that's being extracted from them!

If you don't have uud or would prefer to decode your binaries on your larger news computer, the procedure is somewhat more complex. Plain vanilla uudecode doesn't know

about multi-part uuencoded files, so you have to fool it into thinking that everything is in one part. First, stick all the parts together (using cat on UNIX). Edit the resulting file. Now remove all the extraneous lines of text in between the parts -- this includes mail headers, any text, lines of the form "include foobar.uad," "table" lines and the lists of characters following them, and "begin" lines other than the one at the beginning of part 1. Once you have converted all the parts into a big uuencoded mass (with no blank lines!), the regular uudecode program will work.

Obviously, this is something of a hassle, and the recommended procedure is to try to install uud on your large computer. You'll usually want to minimize the amount of data you have to send to your Atari, since you'll most likely be downloading it at a relatively low speed, and the uudecoded .arc file is the smallest thing you can download.

Zoo is available from the archives. It is simple to use; refer to the documentation included in zoobin.arc (yes, you need to use arc to extract zoo!) for more information. The uudecoding process is the same for zoo and arc files. Lharc is also available.

Most archives contain documentation; refer to the instructions in a specific program for usage information and the like. If you have problems with a particular program,

send mail to the submitter (listed near the top of each part.) The moderator doesn't have time to become very familiar with all the programs that are posted, so the submitter will probably be much more helpful.

_4. _L_i_s_t _o_f _a_r_c_h_i_v_e _s_i_t_e_s

Note: I have not verified these, so this list may be wrong. Mail servers usually respond to the word "help" alone in a mail message. Some of the sites listed below may not contain full archives of comp.binaries.atari.st, and some may have other files.

The Amiga world is already the unfortunate victim of a virus that was
apparantly meant as an attack on pirates called "lamers", hence the name
Lamer Exterminator. It works by screwing up diskcopies (only) by, I
believe, writing the word "LAMER" to random blocks during a diskcopy.
Needless to say this virus rapidly escaped the bounds of pirates and is in
the general Amiga community. I am not sure who I would consider the
bigger scumbuckets, big time pirates or destructive virus programmers,
so it is hard to decide the lesser of these two evils.

BTW, I think that a lamer is a type of pirate who just passes the
disks around but doesn't do any cracking or the other hard stuff
himself.

former ST owner who liked the
computer but not the companies
policies,
Rick Hunt

1974. RE: PYRO Screen saver.....

>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>

I myself use a PD program called PRYO which is modeled after the screen saver for the Macintosh under the same name but is not PD. Anyway, this screen saver displays alittle firework show. It could be the same as the "stars" that everyone keeps mentioning. Anyway, if you are using a color monitor, then it diplays fireworks of random colors at a random intervals on the screen. No matter what rez you are in it will use 16 colors. In mono, it only uses white. I like pyro because it reminds me if I forgot and left my computer on. I haven't had any problems with it interferring with any other programs but my software base is limited.....

>You need the "uncompress" utility to decode them. As far as I know, neither
>compress nor uncompress has been ported to the ST, you'll have to do this on
>a UNIX machine.

They're available for the ST, honest! Just check terminator!

The files on wuarchive are the actual usenet articles, compressed. That means
that to get a usable file out of 'em, you need to uncompress, uudecode, and
then unarc.

The ST version is a full compress-4.3 utility, it'll compress and uncompress
with up to 16 bits of hashing, Just Like Real Unix.

1976. Re: Fine Scrollin'

Newsgroup: comp.sys.atari.st
Date: 1990-02-20 23:08:26 UTC
From: dac@ukc.ac.uk
Message-ID: <2823@gos.ukc.ac.uk>
Source record: 243220

Recently there has been a query about smooth scrolling on the ST and the technique of using overscan was mentioned. Well, here is my offering. The source code below is in 68000 assembler and implements the overscan technique. The code allows physbase to be positioned on any 8 byte boundary.

I hope the code is self explanatory. The overscan code takes 20 scan lines to play with overscan and 2 for overheads. To remove this loss from the normal playing area I've put the overscan in the top border. This gives rise to two `features':
a) The screen is now around 208 lines long.
b) Screen memory is offset by two bytes.

So, your screens start at address $78002, $7800a, etc.

The 208 lines bit can be sorted out as it's just a matter of when the palette is re-loaded. Just hack off the end of the code and set a raster interrupt (timer B) to restore the palette.

The program loads a .pi1 file into screen memory (defined as $78002) and allows you to scroll around it using the cursor keys. The only way out is to reset the machine. Sorry, but I use a program I wrote that throws me back into my assembler (DevpacST) on pressing RESET.

You can play with the code to your heart's content. If you know any games programmers who don't have scroll code then please make sure they get it. The new STE has a video address low byte. The old ST doesn't. We NEED high speed action on STs. This and similar code is a step towards it.

PROGRAM SOME FAST GAMES NOW!

Imagine Speedball with hardware scrolling...

This code gives smooth vertical scrolling. Horizontal scrolling can be done by building N screens and flipping between them. For example, 8-pixel scrolling can be done with 2 screens, 4-pixel scrolling with 4 screens, etc.

Figure it out. There may be alot to keep track of but it'll be DAMNED fast.

One last thing. And it's important.

The top border code runs from timer D. The timing of the interrupt is critical. There are potential problems:
1) The interrupt may be delayed whilst a long 68000 instruction is executed. Something like a divide or movem with LOTS of registers. I don't know if this will effect the code but if something goes wrong then careful time planning can solve the problem.

2) Another MFP interrupt may trigger just before the timer D one.
This is a SERIOUS problem. The interrupt acknowledge all by itself
will throw the timing out. The solution is, fortunately, quite
simple(ish):
Set another interrupt to go off just before the timer D one.
In it, disable all other MFP interrupts. At the end of the
scroll code (after re-loading the palette), re-enable the
interrupts. This should be done using the mask registers
rather than the enable registers.

3) Along similar lines: As timer D is set up from the VBI, if the
VBI is delayed by an MFP interrupt then, again, the timing will
go wrong. A solution works along the same lines as for (2):
Assuming the scroll code is solid, at the end of it start
another timer which will interrupt just before the VBI. In
it, disable the MFP interrupts. After timer D initialisation
in the VBI, re-enable the interrupts.

4) The scroll code takes around 1.4ms (about 7% processor time).
During this time no keyboard interrupts will be handled. It is
possible, therefore, to lose keyboard packets. There is a
solution:
The border code is full of nops. These are for timing. Each
nop gives an 8 cycle delay. During the longer nop delays
it is easy to put in code which checks the 'buffer full'
bit of the keyboard ACIA and stores the data byte if
appropriate. Be sure to calculate cycle times accurately
as a single timing miscalculation will produce all sorts of
weird effects.

Although these problems have to be ironed out the technique is VERY powerful.

Enjoy,

Dave.

PS. As it is the program will not assemble as a line has been commented
out. The line is:

```
* .fname dc.b 'picture.pi1',0
```

The asterisk should be removed and the quotes filled with the name of your
favourite .PI1 picture.

```
------------------------ GO FOR IT -----------------------

* This code implements hardware scrolling on an Atari ST (NOT STE).
* This code is (c)1990 David Clear and is free.
* Feel free to use this code or modifications of it for whatever
* you so desire - commercial or private.
*
* NOW LET'S HAVE SOME DAMN FAST NEW GAMES!
*
* Note:
```

```
* A 'feature' of this code is that it displays around 208
* scan lines instead of 200. If you want to force 200 scan lines
* then you can:
* a) Re-write the top border code and extend the
* timer D delay.
* b) Remove the palette re-load at the end of the
* scroll code and set a raster interrupt lower
* down to re-load the palette.
*
* Important routines:
* myvbi - Timer D startup code & register loading.
* topb - Top border scroll code.
* setscrn - Screen address setup.

* Macro to create a given number of NOP instructions.
* Used for timing.
* eg:
* nops 4
* creates:
* nop
* nop
* nop
* nop
*
* 1 nop is 8 cycles. Long numbers of nops can be replaced by dbra loops
* and the like.
nops macro
dcb.w $4e71,\1

1977. Re: Becoming an official Atari Developer

Newsgroup: comp.sys.atari.st
Date: 1990-02-20 23:28:36 UTC
From: mj@myrias.com
Message-ID: <635556517.22235@myrias.com>
Source record: 243221

Please note that attached note is posted on behalf of Johann Ruegg
from Sozobon Ltd. I can only add to it that developers situation
seems to be much clearer in U.S. than in other countries, like
Canada. Long time ago I paid my $300. I do not complain. I got my
standard package with Alcyon C and later some updates and MadMac. But
otherwise, most of the time Atari Canada simply pretended that I do
not exist. Sometimes what I explicitely requested something I got it
(S.A.L.A.D.); sometimes I did not (anything on Mega). But now will be
close to two years, I guess, when it was the last time when I heard
something from them. I guess that it would be easier if I would live
in a Toronto area, but Canada is a quite sizeable country, you know.
Michal Jaegermann
mj@myrias.COM
>>>>>>>>>>>>>>>>>>> cut here >>>>>>>>>>>>>>>>>>

There has been some discussion about Atari's developer's program
recently. The problem for Atari seems to be a major one. I can
see why it is still being refined.

Sozobon Ltd. would certainly like to remain "official". It seems we
will probably get in under the grandfather provision (unless that changes).
But consider the alternatives:

1) Does Sozobon C qualify since it is used by at least 10,000
ST owners worldwide (the number is just a guess).

2) Does Sozobon C qualify since it has been reviewed by ST World?

3) Does Sozobon C qualify since it is the basis for a series on
C programming being published in a German magazine.

or 4) Does Sozobon C NOT qualify simply because it is FREE.

If we could get discounts on a TT, we MAY feel like coming out with a
version of the compiler that supports the 68030 instruction set better.
If not, we probably cannot afford to do this.

Perhaps we should make the next version Shareware instead of Freeware so
that we can be "offical" developers???

Or would someone like to volunteer to publish the Sozobon debugger
I am working on "Commercially"??

Note that Sozobon Ltd is a real company, although our gross revenues for
1989 were something like $300.

I am not trying to suggest that Atari should abandon its developer's program.
I just think they are going to have to think about it very carefully.

Before, they were just selling documentation and a compiler for $300.
When you add the possiblity of hardware discounts, the picture becomes
a lot cloudier. Anyone seriously considering buying a TT would gladly
pay $250 to get a $1000 discount (or whatever it will be).

On the other hand, Apple got itself in trouble by making all potential
developers submit a detailed proposal of their product. If they didn't
like what you were making, you didn't get in.

Ritzert@DMZRZU71.BITNET writes:

>[We have a program which dies; poolfix3 improves it a little.]
>Question to Allan or Ken:
> Shall I install folder100 in addition [to poolfix3]?

You should certainly use foldr100. Poolfix3 only fixes a bug in
the code which manages GEMDOS's internal memory. You can still
run OUT of memory there, and FOLDR100.PRG adds more. A program
which uses Malloc() a lot, or has lots of open files at the same
time, can use up all this memory.

If you see the "panic" message, it's USUALLY because you ran
out of pool memory. Using poolfix3 will not change this.
Using FOLDR100 will.

Poolfix3 should print a message when it runs; that message either says
it was INSTALLED or says there was some error. The most common error
is that it can't find GEMDOS: if some program has run earlier in the
AUTO folder and swiped the GEMDOS trap, that'll do it. (Other messages
include detecting that your GEMDOS doesn't need poolfix at all, and
that your GEMDOS *does* need poolfix, but it can't be installed for
some reason. That one should "never happen.")

>Hello I would be interested in knowing at what price you would expect to get
>for an XEP80. I have been wondering about the usefulness of XEP80z.

XEP80's run at around $80 through mail order, don't they? I bought a used
one through the net for $40. I would guess that the guy with 5 would probably
take $40 or $50 (forgot the name).

I think that the Atari is missing something at 40 cols. I think 80 cols
almost makes it a computer (now all I need is a hard disk or ramdisk...
sigh). Software would be the issue. Any program that dosn't conflict
with the driver (in memory), that does standard I/O to the E: device should
work. My editor, which simply repaints the screen with any change doesn't,
so I am in the process of rewriting it (and am including many other features
as well). I think it is a great addition. The XEP80 includes a parallel
printer port, which I haven't needed or used yet.

One more idea for Atari people to consider: Sell the Stacy
LCD screen as a separate accessory, able to plug into the regular
video port of the ST line. Why? I have a color monitor and Spectre
GCR. I would love to have the high resolution of a mono monitor,
but there is no room on my desk for one more bulky CRT. On the
other hand, a nice flat LCD mounted on a swing-away or flip-up(down)
mechamism attached to the color monitor would be just right. Even
if it costs morethan a mono monitor, the space/weight savings would
be worth it to me.
If you do it, Atari, remember to send me one free for making you
richer.

From: johns@maccs.dcss.mcmaster.ca
Message-ID: <25E23F0A.12830@maccs.dcss.mcmaster.ca>
Source record: 243231

I've been doing some GEM programming with Personal Pascal
and have as of yet not had a problem I was not able to figure
out after a while with a little help.

However, I've got something here I've never seen before.

My program throws up a menu bar then a window, and everything
is cool. I realized I need another window, so I coded it up.
It compiled fine, and it does put the window on the screen nicely,
but the mouse pointer and the menu bar seem to interfere with
each other. Garbage will be left where the mouse pointer pops
down a menu, and things like that. Not a pretty sight.

Has anyone ever come across something like this? I really wonder
what I'm doing wrong.

Maybe I should have done this in C. :-)

AAron nAAs asked:
>Anyone in Europe or Canada have programs that will take
>advantage of the STe's new features?

Bob Brodie from Atari US showed us a 4 Meg STE this weekend, and showed two programs for it...

One was a "bouncing ball" demo from Australia, with not so great graphics (it was designed for a 50hz PAL system, so they might have been great, but we didn't get to see them that way), and some really great sound by way of th PCM digital sound output of the STE.... (AXEL-F from Beverly Hills Cop in stereo...!)

The other was a game written by Atari's game division in Chicago... it was a "River Raid" kind of thing called "Whitewater... (Something or Other)" and came on two disks.. the first disk booted, started up the music and then rather imperiously demanded, in a digitized voice, "DISK B... DISK B..."

While Bob declared, rather frankly, "I wouldn't buy this game," several peopl who had a chance to play it at the MACE user group meeting said it wasn't bad in fact, there were several requests for copies. (Unfortunately it won't run on anything other than an STE...)

When asked, Bob said Atari has no current plans to market the game. Someone at the meeting did mention another commercial release of a game for the STE, whose title escapes me though, at 3AM....

>P.S. My STe is Serial number 310, bought in Canada, and label
> says that its a US machine!!

Bob told us that what happened to the US STE was that it failed its FCC type acceptance tests. While they redesigned the internal shielding, they shipped the already assembled units to Canada for sale there... thus the "U.S." label on the unit purchased in Canada....

I ran a DEMO that does this on an STE and the video hardware really chucked
up on it. The custom chips on the STE no longer have the same quirks as the
old ones so if you don't want to lose compatibilty don't do it. Also the
sync scrolling technique uses frequency toggling and I believe loses on
a native 60Hz display.

1998. Trying to use GNU MAKE with Lattice C

Newsgroup: comp.sys.atari.st
Date: 1990-02-21 12:24:58 UTC
From: R.A.W.McGuigan@newcastle.ac.uk
Message-ID: <1990Feb21.122458.25474@newcastle.ac.uk>
Source record: 243241

Hello - this is my first posting so I hope I'm doing things right?!

I recently obtained a copy of GNU Make for the Atari ST. I use Make quite a lot in my work so I was interested to see what it was like on the ST.

Now, I have Lattice C (V3.03). It comes with the GST linker, which is driven by a script file, C.LNK, which contains a list of binary files to be linked. It seems to me that the idea of using Make and the C.LNK file are mutually exclusive as surely the list of files to be linked, and the linker itself, should be managed by Make from a makefile. Also, the GST linker does not examine any out-of-date dependencies in the C.LNK file, so it would be preferable (in my mind anyway) to use Make and a makefile to handle (both compilation and) linking, rather than the Lattice/GST linker method.

Is anybody out there using a similar setup? Advice please?

Thanks,

Andy

> Does any other editor support such useful commands as
> SHIFT, ZONE, MERGE, OVERLAY etc.?

Actually many of the micro editors are much easier to use, thanks to a much better interplay between user keyboard screen and mouse. You have a large choice of editors on for instance the Atari. If you don't like a window orientation and hate vi or emacs there is still the very powerful editor STedi which takes much of its user friendliness from the Apollo editor (and several others), is extremely easy to use and very fast. It can do many things your XEDIT cannot do. If you want to know whether other editors know the commands `SHIFT, ZONE, MERGE, OVERLAY' you better explain what they do. I have the impression from their names that most decent editors that can handle several buffers (or windows) have some like it but under a different name.

Actually the next version of STedi will even be far more powerful as judged from the beta version. It has full regular expressions and a complete macro language. If SHIFT is what I think it to be the regular expression
//^/=/ / (replace begin of line by blank) should do the job
(and so on)

Actually discussing editors is like discussing religion.
Its hard to convince a Jehova witness.

>upward battle.

This is undoubtedly part of the answer.

The explanation I have heard from people who study the
personal computer market (and this is the one that makes the most
sense to me) is pretty simple: Europeans have less disposable income
than Americans. Period. If the European user wants to buy a PC, he
cannot afford the cost of an IBM or Mac. (And if you think they are
ridiculously priced *here*...try going to Europe sometime and
pricing a Mac...if you can find one.) So they buy the lesser priced
Atari's and Amigas.

Now, if that is the reason, we may see all of this change as Europe
becomes an even larger financial center in the 90's. (Reunification
of Germany, Europe common market, etc.) There may be more
disposable income to go around...

2001. C programming. DAs VS PRGs

Newsgroup: comp.sys.atari.st
Date: 1990-02-21 15:35:01 UTC
From: covertr@force.UUCP
Message-ID: <48c733f6.14a1f@force.UUCP>
Source record: 243243

The October 1989 issue of "STart The ST Monthly" USA magazine has an article describing how to write a desktop accessory that can be run as a PRG just by renaming the file from ACC to PRG. It gives some sample code and a RSC to C dumper program as well. Oh yes, the examples for C programs.

Has anyone tried to use the ideas in this article?? I have several programs that I have written as PRGs which would be nice to run as DAs. I have followed the guidlines in the articles (i.e. no menu bars as DA can't have them).

I use Mark Williams C and WERCS as my major development tools. Any ideas folks??

P.S. I am looking for any good examples of GEM AES/VDI C code in MWC form. Aren't there *ANY* C programmers out there??

P.P.S. someone mentioned the great docs for the Prospero C compiler but said that the GEM AES/VDI was mainly from the DRI IBM version. Does anyone own the Prospero? Care to comment about the docs?

P.P.P.S. How about the Lattice C compiler version 5?? I have been trying to order it from my local (Phoenix AZ USA) ST store, but no one distributes it in the USA yet. Could someone from the UK tell me of a reputable mail order company who could ship overseas?? I would really like to get the new version of Lattice C from HiSoft. How good are the docs to it??

2002. Gulam Keyboard Remapping

Newsgroup: comp.sys.atari.st
Date: 1990-02-21 15:56:34 UTC
From: FCTY7284@RYERSON.BITNET
Message-ID: <90Feb21.110418est.57412@ugw.utcs.utoronto.ca>
Source record: 243244

I'd like to be able to use Gulam with a Dvorak-remapped keyboard, but it doesn't coexist with the current Dvorak remapper I'm using. Apparently Gulam uses its own internal keyboard translation table, and there is a small program that remaps the internal table.
The Gulam keyboard remapper must be specific to the version og Gulam or it will remap the wrong area.
The remap program doesn't seem to be in the UOGuelph or Panarthea archives. Would some kind soul send me the remapper and the corresponding version of Gulam, in UUE format?
Thanks.
Peter

From: toml@xrxedds.UUCP
Message-ID: <TOML.90Feb21113122@nighthawk.xrxedds.UUCP>
Source record: 243245

ST Informer
909 Northwest Starlite Place
Grants Pass, OR 97526

12 issues (U.S. 3rd class) $18
12 issues (U.S. 1st class) $27
includes a free PD disk with each 12 issue sub.

i've subscribed for about a year, and i'm fairly pleased. they used to send out 'free trial' issues periodically, then threatened to stop, so i decided to send them some money. there's too much game junk, not enough hard tech stuff (does anyone know of an american magazine worthwhile in this regard?). the news coverage is good though. i plan to renew (what more can i say?).

ST World
2463 Latona Ct NE
Salem, OR 97303
$18/yr

i also get 'st world' (the american one), which in my opinion is another kettle of fish entirely. i've never seen a more poorly edited rag - i admit i'm a bit of a stickler for grammar and syntax, but i find st world utterly offensive in this regard. content-wise it's rather mixed. it is also a rather self-promoting magazine (there is some sort of connection with the world of atari shows). the main reason i subscribed was to read dave small's column. i will probably not be resubscribing to st world; if i do it will be solely because of dave small.

by the way, i've noticed that both st world and st informer are rather cavalier about keeping their production deadlines. however, unlike st express, i don't believe either rag has screwed me out of an issue yet.

Current Notes
122 N. Johnson Rd
Sterling, VA 22170

$24/yr (10 issues)

there's also 'current notes', produced in my hometown of sterling va by joe waters. CN is associated in some strong sense with WAACE, the washington area atari computer enthusiasts (or something like that). this is the same organization responsible for the annual WAACE Atarifest held in fairfax va. if you have never seen an issue of current notes, you're missing a pretty good atari magazine. it's a

user group mag, not a STart-style slick thing, but it has good broad coverage of the industry, real software, games, news, etc - and, the editorial quality is excellent. CN also has an enormous PD library (8 bit, ST, and Magic/Specre) at $4 per disk. joe, if there's any way for you to read this - bravo on nearly six years of great work!!

At offset 0x358 in the program (0x374 in the file) is the following line:
h358:
cmpi $0x7d00,d0 / 0c40 7d00
That is, add 2 to the above address and the 7d00 is the delay in vblanks.

0x7d00 = 32000 counts, at 60 hz, 533 sec, 8.8 minutes

2006. Atari ST Sequencers

Newsgroup: comp.sys.atari.st
Date: 1990-02-21 18:24:18 UTC
From: dvac@druwa.ATT.COM
Message-ID: <4648@druwa.ATT.COM>
Source record: 243248

Scenario: If I was to get a 1040ST, I would want to use it to do some sequencing in a live situation..... Is there any sequencing software available for the 1040ST that would allow us to do the following stuff:

* Trigger a sequence externally from another MIDI device such as a drum pad, or MIDI foot controller.

* Able to have multiple sequences loaded at a time, and trigger them individually of each other. Say for instance the beginning of a tune and the ending of a tune have some keys... Trigger the starting sequence with one Midi trigger, and trigger the second sequence with a second midi trigger.

* Have a metronome (click track) type of thing for an earphone monitor for the drummer (like 4 or 8 beats before the sequence starts).

I think the things I have listed above are in the order of importance.... SO, is there anything out there for the ST that'll do this for me?

Please reply in e-mail if you can, and thanks in advance for any help!

Later - Dan Vachon - !att!druwa!dvac

There are several PD utilities that do this, none of which seem very robust
(ie they make everything crash!). One commercial product that I know of,
Omnires (sold through E. A. Brown Co. for about $35) also does it, and it
seems to be more forgiving. It also give the ability to emulate a color on
a mono (with grey scales, of course). Several different methods for both
types of emulations are included, you are instructed to pick the one you
like the best (dithering, etc). I would recommend that you get a real mono,
as they are cheap (hell, you might be able to get a used one for $60) and
they look sooo good (70Hz is hard to beat, best monochrome screen I have seen).

There is an ehanced version of PYRO on genie that allows you to
configure the timeout delay. I now prefer PRYO.PRG to STARSTRK.ACC
because 1) it doesn't seen to interfere with anything the way STARSTRK
does 2) it's an autofolder prg not an acc 3) it's configurable and
4) it's better aesthetically.

If there is sufficient interest I can post the configurable version
of PYRO to the binaries.

Message-ID: <9002212030.aa00488@benjamin.Cs.Bham.AC.UK>
Source record: 243101

I tried the RateHD a day or so ago - it is supposed to determine the speed of a hard disk *independant* of the OS slowing it down (:-). Anyway - I tried it on my Supra, and it gave something like a 40ms access time. Then I defragged my root partition (only about 4Megs) and ran it again. This time, the access time was only about 36ms! Has DLII (the defragger used) done something unexpected to my drive, or has RateHD gone doolally?

Like I said "MAX is not a number, its an expression." There is an integer
in the expression (the number 32768). But there is also an operator (the
unary minus). This makes MAX an expression, not a number. Thus the real
question is what does K&R say integer expression are evaluated to? I
don't have K&R handy, but I believe it says long ints.

2013. Booting PC Speed from Hard Disk

Newsgroup: comp.sys.atari.st
Date: 1990-02-21 21:17:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <90Feb21.162149est.58457@ugw.utcs.utoronto.ca>
Source record: 243105

The following describes the sequence I went through to try and get
PC Speed to boot DOS from my SH204 drive (which, incidentally, did not
work).

1. PC Speed software installed on drive C: (TOS HDX boot)

2. PC_INST.PRG used to assign DOS C: = TOS D:
DOS D: = TOS C:

3. run PC Speed and boot DOS 3.2 from A:

4. format C:/s (this put IO.SYS,MSDOS.SYS and COMMAND.COM on my
TOS D: partition which PC Speed was told was my DOS C: partition
(from step 2)

5. exit back to GEM and re-run PC_INST.PRG to set boot from HD.

6. re-run PC Speed and ZIP, the system just hangs.

What did I do wrong?

I am still getting stack overflow messages if I switch menus in dBASE III
Plus too fast (takes more effort than before I resoldered my board socket
but it still happens). Any PC Speed specialists on the NET to address my
problems?

2016. Megaproblems question

Newsgroup: comp.sys.atari.st
Date: 1990-02-21 22:32:00 UTC
From: RJOHNSON@CEBAFVAX.BITNET
Message-ID: <9002220808.AA28345@ucbvax.Berkeley.EDU>
Source record: 243108

My question is concerning problems I have been having with a
Megafile 30. My system is a Mega-4, Megafile 30, and an SC1224 monitor. My
problem is that on an intermittent basis my system simply decides not to boot
off the hard disk. The process goes something like this.

a) The system boots with the standard messages and everything in
my AUTO file executes perfectly.

b) The screen flashes a colorful pattern and then restarts the boot
process. GOTO a)

What seems to cure the problem temporarily is for me to reformat the
hard disk and reinstall my files. It will then run fine for a couple of months
with a gradual deterioration until once again I can't get it to boot at all.
Note: Even when this is at it's worst, I can still get the system up by booting
off the Atari Hard Disk Utilities Disk, and running AHDI. My drive then
functions perfectly until I turn the system off. My guesses as to possible
sources of the problem at this point are:

a) The gradual fragmentation of files on the disk over time somehow
creates my problem (perhaps somehow corrupting the boot sector).

b) A virus. (I unfortunately don't have any virus finder software.)
If someone could send me a binary of vkiller it would be appreciated.

c) Some undocumented feature of my Mega relating to desk accessories.
I think this is possible, because I have found that the problem
SEEMS to be affected by whether I have and even or odd number of
desk accessories installed. (I have tried it with no desk
accessories and I still have the problem, but is 0 even or odd?)

Someone HELP! PLEASE!!!

2020. Re: GDOS fonts.. correction

Newsgroup: comp.sys.atari.st
Date: 1990-02-21 22:42:00 UTC
From: tellabs.canada@canremote.uucp
Message-ID: <90030820221338@masnet.uucp>
Source record: 243112

I'm sure a few have caught the error in my posting some days ago
regarding the use of GDOS fonts. In my original posting, I'd stated that
the function used to select a font, vst_font(handle,font), required
'font' to be the Nth font loaded by vst_load_fonts.

The function vst_font(handle,font), will load the font whose
unique font id is 'font'. The function returns the actual font set as a
result of the command (ie. its font id).

One thing I neglected to mention in my earlier posting, if you
open more than one virtual workstation a program - if for instance, you
open up a virtual workstation for every window in your application, then
you must call vst_load_fonts(handle,0) for each one in order to access
your GDOS fonts when drawing in that virtual workstation. If the fonts
are already loaded for another virtual workstation, the function will
not load them again. The purpose of the call seems to be a matter of
GEM housekeeping.

>sync scrolling technique uses frequency toggling and I believe loses on
>a native 60Hz display.

I ran "The Cuddly Demo" on a STE and, sure enough, the sync scrolling died. Its use shouldn't be ruled out though. It is the fastest way to do high speed scrolling on a ST. If you're planning on writing a fast scrolling game on a STE using its hardware support then, if the design is portable, it may be worth writing a dual version with two screen handlers for the two STs.

As far as I know most games run in 50Hz anyway as this gives the code 1/50th of a second per update rather than 1/60th (obvious). So you get more time per frame using 50Hz. If you can't run every frame then every other frame at 60Hz looks smoother than every other frame at 50Hz (my scroll code forces a 50Hz screen - I haven't tried to make it run on a 60Hz screen and I'm not sure that it's possible).

The code I posted last night to do sync scrolling was very fragile timing-wise and I suggested using two timers to make everything solid. Well, in the light of day I realised that the HBL can be used to sync at the top of the screen (and a nop is 4 cycles, not 8 as I said). Anyway, using the HBL can make the whole thing very solid.

Maybe you've noticed, I really am trying to plug sync scrolling. I haven't the time to write anything commercial but I really do like high speed shoot-em-ups and believe that fast, every frame update is a must. Sooner or later such games will appear for the STE and older STs will be left standing. Fast scrolling CAN be done on a ST. You have the code. Read it, understand it, re-write it and use it. Games for the ST will never have the sound quality of the STE, or the BLiTTER speed, or the specialised video chip functions, but it's gameplay that really counts and fast scrolling is it.

Dave.

PS. I always wanted LucasFilm to do "Rescue On Fractalus" for the ST...
Hey! What ever happened to "Defender"? A *real* version (with original(ish) graphics)?

>as they are cheap (hell, you might be able to get a used one for $60) and
>they look sooo good (70Hz is hard to beat, best monochrome screen I have seen).

$60!!!!!?????!!!! I would settle for finding one for $100!

I have been shopping around a little for a mono monitor, and the cheapest
NEW price I have found mail-order is $160 (locally, the only place in town
want $200). I have been as yet unable to find a used one for even $100,
let alone $60.

If anyone knows of or has a monochrome monitor they want to sell for a
decent price, PLEASE! let me know (Spectre can be *painful* on a color
monitor).

2024. help with io redirection, please!

Newsgroup: comp.sys.atari.st
Date: 1990-02-22 00:58:00 UTC
From: Ritzert@DMZRZU71.BITNET
Message-ID: <900222005804.790174@DMZRZU71-UNI-MAINZ--GERMANY>
Source record: 243116

hi,

I don't understand why redirecting the input of Cconrs() doesn't work.
Here is a simple example of what I'm trying to do (compilers: Laser C
1.2, GCC 1.34):

```
/*%%%
```

If I remember correctly from the previous discussions of io-redirection, this code should work (it does work when I try to redirect stdout). But it doesn't. Instead, the demo program still waits for input from the keyboard. What am I doing wrong, what is the correct way to redirect the input to Cconws() ?

BTW, the Absoft librarian also uses Cconrs() to read its commands...

Thanks for any comments

Michael Ritzert

2025. FFT.PRG

Newsgroup: comp.sys.atari.st
Date: 1990-02-22 01:37:38 UTC
From: ehood@ics.uci.edu
Message-ID: <25E34262.2046@paris.ics.uci.edu>
Source record: 243117

I recently got FFT.PRG from the panarthea server. It calculates Fourier transforms and does graphs. My problem is that the GFA basic code used to generate the files is an older source code version than the GFA basic I have (I got 3.0).

I was wondering if any body has an earlier version and can translate the siggen.bas to ascii so I can load it into GFA 3.0.

I would appreciate it if any body could help.

Thanks, :')
Earl

>
> Does anyone out there have any source code that would allow Sozobon C to
> use the A-Line functions and AES? I've gotten version 1.2, but it seems to be
> lacking in a few areas, like support for all the nice graphics of the ST.

I'm responding here instead of mail because this is a question of general
interest.

These are two different issues.

First issue: the AES (and VDI).

AES calls are supplied in the GEMFAST bindings by Ian Lepore. GEMFAST is
in the Panarthea archives. The package includes a library of AES bindings,
a library of VDI bindings, and some utility functions. The current release
seems to be pretty reliable. Among its nicer features is a fsel_exinfo()
function that checks the GEM version and fakes the extended file selector
features if you don't have TOS 1.4 or better. It's written in MadMac, so
you can't alter things with the Sozobon assembler, but you can get it in
object library form. Incidentally, Ian should be reachable at
ian%fwbbs.citadel@thelake.mn.org.

Another, older set of GEM bindings, GEMQ by Don Farmer, also is available.
It's less fully featured, but it will assemble with jas.ttp.

Second issue: Line A.

Atari has surrounded Line A with nondisclosure agreements. There is not,
to my knowledge at least, a set of PD Line A routines. J.R. Bammi wrote an
aline.h #include file that might help you roll your own. It tells you what
values you will be able to find/change based on the Line A pointer.

You can write the basic Line A functions easily enough -- using embedded
assembler if you want. Basically you're putting illegal opcodes in the
text portion of your program. If you do:

```
char *getlinea()
{
asm(".dc.w $A000");
}
```

... you'll have a Line A init function. A pointer to the Line A block will
be returned (in D0).

However, you must not try to run this -- or any C code with embedded Line A opcodes -- through Tony's optimizer. You'll have to untangle the raw output of hcc by hand, producing this:

```
.text
.globl _getlinea
_getlinea:
.dc.w $a000
rts
```

... which you probably should have written in asm in the first place.

Generally you stuff the right values into the right memory locations, and/or place an address in register A6. Then you feed the right $Annn value to the 68000. Zap! But figuring out what locations need to be fed what values is a big pain.

I haven't found Line A to be worth the hassle for general programming except for obtaining (and modifying) such system variables as the number of lines and columns on the TOS screen.

Here are some opcodes:

```
$A000 initialize; returns Line A pointer in A0 and D0, font table
pointer in A1, and function table pointer in A2
$A001 put pixel
$A002 get pixel; returns a value in D0
$A003 draw line; may return a value (??) in D0
$A004 draw horizontal line
$A005 draw filled rectangle
$A006 draw filled polygon
$A007 bit block xfer
$A008 text block xfer
$A009 show mouse
$A00A hide mouse
$A00B transform mouse
$A00C undraw sprite
$A00D draw sprite
$A00E copy raster form
$A00F seed fill
```

If you start messing around with Line A stuff you'll begin to see similarities between the Line A and the GEM VDI.

Disclaimer: This information comes from various public sources; none comes from Atari documentation (which I don't have anyway). You'll have to determine what works by experimenting at your own risk. If any of this is incorrect, feel free to explain why and how.

>Atari's and Amigas.

Another part of the answer may be: We had an enourmous 64 underground
scene here in Germany. When the ST came out, most cracking groups
and most hackers readily accepted it. They bought it because they
knew at once that this might be THEIR computer. It was and is cheap,
it is fast and relatively easy to program. They crawled deeply into
the machine and wrote the first programs before ATARI came out
with anything decent. This in turn triggered the user market to
grow and set the pace for the rest of Europe. For some reason,
this didn't happen in the U.S. Maybe all the 64 hackers had already
bought PCs before the ST came out.

I think I have found out a way how to transfer money from America to Germany with a minimum of additional costs. If you would like to send me money - say $15 for my Arcgsh - you can proceed as follows:

- Get one of your normal cheque forms (no Eurocheque or something like that needed) and fill in the amount of money you want to transfer. Now comes something very important: Write the amount in your local currency, say US$ or Cdn$ or whatever else it might be! Do _not_ make the cheque out in DM (Deutsche Mark)!

- Put the cheque into an envelope and send it to me by mail.

What shall I do with the cheque? I shall not take it to a bank to receive the money. They will charge me at least about DM 17 (ca. US$ 10)! Instead: I shall send it to my Postgiroamt. They will perform something called "simplified foreign cheque draw in" (my attempt to translate office german into english, sorry). This costs only DM 0.80!

Summary: Minimum additional costs for the sender (standard cheque form, envelope, postage), minimum costs for the receiver (DM 0.80).

Who is willing to try it out?

> Does anyone have or know how to get schematics for
> the Atari-520ST?

The original 520ST was released to Howard Sam's ComputerFacts.

You can often find these in libraries -- as I did.

However, later versions of the 520ST and none of the 1040's and
Mega's have Sam's for them. I guess Atari decided to keep it
all secret. Still, except for blitters, etc, the general chip
set is the same (I presume) so the 520ST schematics might be
a good starting off point for other versions.

The documentation is excellent. The distinction is between GEM Versions 1.1
(ATARI) and 2.0. Both GEM 1.1 and 2.0 AES/VDI bindings are described in detail.
The documentation clearly states 1.1 and 2.0 features of a particular
bindings or whether the function is new for V2.

Hello,

The are to my knowledge two such programs which allow mono vision
on an ST color monitor. The only one I've ever seen is Omniview, I will
say however that even though it is capable of many tasks, not all software
will work, and it certainly isn't near mono res. Why not just buy a mono
monitor, they are $200, and a Monitor Master switch is $40
This omniview package goes for about 60 - 70 dollars.

Yes, DC Port gives an extra two serial ports, tacked on to the cartridge
port (they also have a version that gives a total of 5 ports--ARMUDIC,
a club BBS in the Wash, DC area uses the 4-port version; works like a charm
with Michtron BBS 3.0!).

Anyway, I don't think DC is set up to take Visa charges. I've been over
my hardcopy shareware docs as well as the DC Utils manual, and can't find
a phone number. However, their address is:

Double Click Software
P.O. Box 741206
Houston, Texas 77274

DC also runs a bulletin board at (713)-944-0108. (300/1200 baud only).

Mike Vederman reads the Net, too. The address is uace0@uhnix2
(or was when my shareware docs were printed)

Message-ID: <9002222156.AA23492@fsucs.cs.fsu.edu>
Source record: 243133

Hey Netters,

Enough! I must build a huge hard drive for my system! Floppies are
for the birds. I know how to do it in general terms (get drives, host adapter,
and controller card, bolt them into a casing), but I do not know what type of
drives to get. Can I use SCSI drives (ie 229n's), or is there a cheaper way
to go. I also want to get the drive units themselves used if possible (not
much cash here). Can anyone tell me a place that sells such drives? I seem
to remember a list of ST usable HD mechs floating around the net, can someone
send me it? I have decided to get an ICD host adaptor, but all I know about
the controller card is that an Adaptec 4000 will work. Any better solutions?
I want to build a system with at least 60 megs, but the more the merrier. If
possible (and if it is cheap enough), I wish to get two mechs, to increase
the chance of saving half my stuff if one crashes. Is this a good idea? Also,
I am waiting (in vain, it seems) for a friend to produce some 65mb 28ms 5.25"
drives, used, $250. Is this a good deal? I do not know the specific make, but
he has one working on his system. I am sick of waiting, someone tell me a
place where I can get close to this deal (if it is a good one)!!!!!

2041. Why IBM disks didn't work for me (and what I did to fix it)

Newsgroup: comp.sys.atari.st
Date: 1990-02-22 22:09:58 UTC
From: boyd@fsucs.cs.fsu.edu
Message-ID: <9002222210.AA23735@fsucs.cs.fsu.edu>
Source record: 243134

Well folks, my wierd problem with the 1.4mb disk drives on IBM comp. has ended. I think this might be rather significant, because I only figured it out by accident.

Scenario: Any time I stuck an IBM formatted disk in my ST, and wrote to it in any way, it would no longer work in the IBM's. (Seems kinda obvious to me now).

Problem: The &**(@&#$&* Key virus!!!! It is everywhere (I hear that it was originally distributed on the Midi Maze game disks, but that is not confirmed). The damn virus, although benign in it's independent state (ie without a key disk to activate it), was on ALL of my disks, most notably my Utilities disk. I never noticed it because it doesn't do anything on ST's, but it seems that it scrags some info in the boot sector that IBM compatables need to recognize the disk. Thus, PSFORM (a PD formatter that produces PS/2 compatable disks) would not work for me, because the virus would be written to the disk right after it was formatted. Also, whenever I used a disk formatted on the IBM, one write from my ST would destroy the disk (as far as the IBM was concerned).

Solution: Get VKILLER from terminator, or someplace, and wipe this one out!! Be careful not to use it on a self-booting disk (and also never use a self-booting disk with your HD on!). It took me about two hours to do, and now I periodically check to make sure is hasn't croped up again. Also, check every disk in your collection. I found the Key virus on some PD disks that I purchased through the mail (and never un-write-protected them). Even originals, unless they are self-booting, should be checked.

Note: I highly recommend the afore mentions utility, PSFORM. I got it from comp.binaries (I think), and it does all it is supposed to do. As soon as I get a hard drive, it will be on the Neodesk desktop.

Query: What is the newest version of VKILLER?

I agree with him that this is an easy way of transfering money.
However, if both parties have postal giro accounts (or whatever
they are called in English), this is absolutely free, and
the currency of the cheque doesn't matter at all. Even the postage
is free!

Even if the receiver hasn't got an account, the fee is only
1/5 of what a bank charges. He will then receive a cheque from
a well-reputed bank, like Lloyds in the UK, I believe.

I've always wondered why payment by postal giro isn't more
popular. Isn't this system available in UK, USA, France etc.?
I know that it is in the Scandinavian countries.

To sum up -

```
IF have_account%=TRUE THEN
PRINT account_number% : REM We all benefit!
ELSE
IF FNsystem_available THEN
PROCget_account
PRINT account_number%
ENDIF
ENDIF
```

(Pascal-, C-, BCPL-enthusiasts etc. will have to mail me to get
an alternate version of the above code :-)

BTW - I'm sorry, but I won't try to send you any money, because I
don't even know what arcgsh is! Perhaps that's self-evident to other
people... :-)

I used to use Flash occasionally as an editor while online (before I switched to Uniterm :^) - thanks Simon!), but I never ran across the phantom typist while doing so - in fact I've never had it happen to me. I have the 85 ROMs and normally have some fairly minor accessories running - the control panel and so forth. What kind of things were you doing when it hit?

Max J.

Message-ID: <1990Feb23.043628.13028@gpu.utcs.utoronto.ca>
Source record: 243141

I wish to keep the mouse cursor within a specific rectangle on the screen. I am sure that I am just missing something, but I can't find any GEM calls which will set the cursor to a particular position. If I can do that, I can keep an eye on the location of the mouse as returned by evnt_multi() and adjust as necessary. I am sure that this is possible because GEM does it when animating the scroll boxes for windows.

2049. (La)TeX on the Atari ST - SUMMARY

Newsgroup: comp.sys.atari.st
Date: 1990-02-23 07:31:50 UTC
From: mikew@wheeler
Message-ID: <3615@tahoe.unr.edu>
Source record: 243143
Cross-posted to: comp.text.tex,comp.sys.atari.st

Here is a (very) brief summary of TeX on the Atari ST computer
resulting from my earlier post for info a few weeks ago.
%--%
From: Jwahar R. Bammi <bammi@alpha.ces.cwru.edu>
1. software... what, where you got it (how), PD, shareware, cost etc.
TeX PD: i ported it
LateX PD: i ported it
metafont PD: ported by John Dunning
font files (pk, mf, whatever) PD: from unix TeX dist
tfm's PD: part of dist or generate with MetaF
previewers (and their fonts) PD: at least two of them: I use
one by robert stabl
printer drivers PD: posted here: epson, hp, slm, nec ...
2. hardware....
1040, Mega[2,4], amount of memory (if nonstandard): my port
runs on 1M or larger St. Previewrs require mono monitor

All of the above and more available for FTP on dsrgsun.ces.cwru.edu
in pub/atari/StTeX
%--%
From: John R. Dunning <jrd@STONY-BROOK.SCRC.Symbolics.COM>
1. software... what, where you got it (how), PD, shareware, cost etc.
Zero cost. TeX etc, MF, Fontware etc were all compiled up from the
sources available from Score (and now Science). There are a couple
previewers available in source form for the ST. TFMs, fonts etc were
compiled up from their MF sources with Metafont.

2. hardware....
M4, but originally a 520 upgraded to 1M.
printer used (and any pertinent details-trials in getting it
to work)
Panasonic 1081. Zero trouble. Just compiled up DVIEPS and off it went.
comments (bugs, koodoos)
It all works. I wish it was faster.
%--%
From: Bob Waltenspiel <bobw@hpsadpk.hp.com>
1. software... what, where you got it (how), PD, shareware, cost etc.
TeX
LateX
metafont
font files (pk, mf, whatever)

printer drivers

I bought the discs from Current Notes. The metafont program would not work
as shipped. When asking for help from someone who posted the mention of
the CN discs they suggested getting MF from an archive. He even called
to find out how it worked. I haven't yet tried it.

2. hardware....
520 w/2.5M, 60M ICD based harddisk, Deskjet.
%--%
From: Michael Ritzert < mjr@dmzrzu71.bitnet >
[Ritzert%DMZRZU71.BITNET@CUNYVM.CUNY.EDU]

1. software... what, where you got it (how), PD, shareware, cost etc.

System a, Office:
plain, gplain (German plain) TeX
tools GmbH, Bonn, FRG
pk fonts \magstep0 - \magstep5, most LaTeX fonts in font libraries
universal screen/printer driver by tools GmbH
supported devices: screen (95 dpi)
NEC P6 (360 dpi)
(fonts and printer not installed at present)
HP DeskJet (300 dpi)
price: ~350 DM including a lot of font disks
comments (bugs, koodoos)
TeX is very fast, printer driver is fast
but triggers tos1.4 memory pool bug.
Screen driver supports high screen resolutions!
Cheap commercial TEX, GOOD support by
tools, extremly good price/value ratio!
2. hardware....
2x Mega4, 2x sh205 (one cabinet with a seagatest 251-1)
both machines upgraded with Hypercache (16 MHz) and tos 1.4
both machines standard monochrome (sm124)
1 HP DeskJet, 1 HP DeskJet+
Network being installed (Ethernet, PAM's Net, TCP/IP)
no problems getting the software to work.

System b, personal:

software:
plain, LaTeX, SliTeX, both English and German
StTeX for 2 Meg System by J. Bammi
Metafont (German PD)
dvist
at present no printer driver, I am going to build one myself
hardware:
Hypercache Mega4, overscan (688x480 pxl on sm124)
GE-soft SCSI hostadapter, Fujitsu m2614 drive (180 MB)
HP DeskJet+

I have just thrown away my illegal copy of tools' tex. The
printer driver will be rebuilt. Metafont runs nicely, no
problems with installation.

%--%
From: Mike Whitbeck < mikew@wheeler.wrc.unr.edu >

1. software
latex, tex, macros: Bammi's port from dsrgsun.ces.cwru.edu
pictex: TUG ($35) (drawing macros)
showdvi: dsrgsun.ces.cwru.edu (previewer)
fonts: J. Longs, + ??? from dsrgsun.ces.cwru.edu
bibtex: J. Longs from dsrgsun.ces.cwru.edu (bib database)
[off and on (more off) I am working on a port of Tib a
very slick bib database package]
mkindex: from dsrgsun.ces.cwru.edu (?) index builder

2. hardware
office: Megafile 30 hard disk,
sm124 (mono),
1040ST connected (UNITERM) to a SUN 3,
these printers are on the Sun's ethernet and I
print from the Sun:
apple laser writer, imagen (now dead, s-o-kay I like
PS better, soon an HPLJ II will be plumbed in)
home: same as above EXCEPT sm1224 (color) monitor + Omnires
emulator, FA_ST ICD 30 hard drive (till it bites the dust).

I've got an idea. My theory is that this may be a HARDWARE problem. Because I for one have NEVER seen it, and neither has a friend of mine. If you're getting it a lot, why not get a replacement IKBD and perhaps some other chips, and try swapping them till it quits.

Source record: 243146

Bernd Esser writes:

>A few days ago, i installed Overscan in my Mega. Unfortunately i had to
>recognize that none of my editors can work with the higher resolution.
>My question is: Is there somebody who kwows an editor that will work in
>overscan mode(i am using a b/w monitor)?

I am using GNOME, a MicroEmacs Clone by Moshe Braner (well, in fact an
extended version of the program). It is small (some 50 k), fast, has
builtin help
but lacks substitute and query replace (can be worked around by a
macro). I find working with it more convenient than with MicroEmacs 3.9.
Invoke the program as
gnome -c 30 -r 86 file.ext
to use the extended screen of 688x480 pixels. The original program is on
various file servers. I got my copy from listserv@canada01, which
recently has moved to a different location.

Michael Ritzert
mjr@dmzrzu71.bitnet

PS: my extensions include german help and error messages, second macro
buffer (nesting of one macro into the other possible), storing of
keyboard macros on disk, improved bufferd disk-io, subsitute and
query-replace commands. Improved buffer printing is being worked on.

2055. 2 Harddrives

Newsgroup: comp.sys.atari.st
Date: 1990-02-23 16:42:36 UTC
From: root@trwrb.UUCP
Message-ID: <292@trwrb.UUCP>
Source record: 243149

Well I finally managed to connect another drive to my SH204. This is what
I did. The details are intended to help lay man like myself.

Equipment list.

1. SH204 harddrive which includes:
a) tm562 20mg drive mechanism
b) adaptec board
c) Atari board
d) fan
e) 50 pin adaptec board cable

The SH204 manual states this drive uses MFM, ST506/412, and
5 megabytes/sec transfer rate.

2. 130 watt external power supply (my original SH204 power
supply had to be replaces months ago).

3. ST251-1 28 ms 40 mb drive mechanism. ($330). This drives uses
MFM and ST506/412. The new drive I bought came with instructions
that explained how to set the new drive to drive #1. These
instructions also explained how and when to remove the terminal resistor
pack. I also bought and returned a used drive that was not
advertised as used or refurbished.

4. Mega style full height case 12"x14"x3.5" ($40 from IB Computers
(503)/297-8425). I believe their cables are over priced.
5. One 34 pins cable with 3 board end connectors.
6. Two 24 pins cable each with a socket connector and a board end
connector.

7. A chip from BMS ($20) to replace a chip in the Atari Board
and corresponding installation software. My version of AHG.PRG
and HDX.PRG would not work with 2 drives or with just the
st251-1. When the BMS software is installing the harddrive
partitions upon booting, the software reads each partition until
it encounters a read error. My understanding is the Atari chip
does not report read errors which would cause the BMS software to
install several partitions. The BMS people were very helpful.
BMS = Berkeley Microsystems (415) 547-2191

8. A power plug connector for the st251-1. I configured the voltages
on this plug the same as the sh204 plug. The sh205 power plug will
fit into the st251-1. Since I could not find the correct plug, I
bought a similar one and cut it into shape. VERY IMPORTANT -
be certain of your voltage wiring - +12 +0 +0 +5

9. Bezel. (not important). My case has no front cover. The front
cover is supplied by the 2 drives and the bezel.

Connections:

* The drives are mounted with the boards facing down. Both drives
are 1/2 height 5 1/4 drives.

* The colored strip on the connectors is pin 1. The board socket
connectors have numbers on them showing some of the pins. The
board end connectors have a cut or slit near pin 1.

* Set drive 1 by moving the jumpers to ds1.
Set drive 0 by moving the jumpers to ds0.

* Drive 0 must be connected to the controller via the outside 24 pin socket
connector.
Drive 1 must be connected to the controller via the inside 24 pin socket
connector.

* The terminal resister pack must be removed from drive 0.
The terminal resister pack must not be removed from drive 1.
On both of my drives, the terminal resistor pack was yellow,
about 1 inch long, had 8 pins, appeared to be soldered but
it isn't, in plain view, and easily accessible.

Mounting:

The holes for mounting the drives are pre drilled into the case. The
equipment inside of my case includes: 2 drives. controller, Atari board,
fan and cables. My power supply is external. I hacked up parts in the
sh204 case to use in my new case. I used the parts to mount the controller
over the old drive and to mount the Atari board to the rear of the case. I
also used the fan from the sh204. The top of the case is not sturdy. I
bought some harddrive mechanism hardware to provide additional top
strength. This part was trial and error.

Good Luck

Gregory Gibson

That message happen to a friend. But I believe that's because I've
patched his Rainbow-TOS for the 68020. The TOS14FIX also doesn't work
(because of Line F). This doesn't matter because I'd included this
patch. Now I'm not sure if FOLDERxxx works after including the poolfix
patch. Which way do FOLDERxxx add memory to the pool in Rainbow TOS?

jimh@ultra.com (Jim Hurley) writes:
>Actually, although I've heard a lot about this bug, I've never
>read a consistent description of the problem.

The TOS 1.4 release notes describe the problem completely and in loving detail. As a rule, YOU DON'T NEED TO KNOW, which is why I don't spend my days posting long explanations here.

What you DO need to know is this:

1. If you have Mega TOS or Original TOS (1.2 or 1.0) and a hard disk, you should use FOLDR100.PRG. Without it, the system starts screwing up when you've visited (or even just brushed by) 40 folders or so.

2. If you have Rainbow TOS or STe TOS (1.4 or 1.6), YOU DEFINITELY NEED POOLFIX3.PRG!

(2a. STe TOS is just like Rainbow TOS in almost every respect; it isn't an "enhancement" and you shouldn't wait for it to come out for the ST. It's just Rainbow TOS with modifications to make it run the STe.)

3. If you have Rainbow TOS or STe TOS you MIGHT want to use FOLDR100.PRG. The management of the internal memory (which FOLDR100.PRG adds to) is greatly improved, but you can still run out. It's no longer a question of how many folders you've "seen" but rather of how many folders and files are ACTIVE, which is to say, in use at any one time. Most people don't open a file 40 directories down in their heirarchy, or two folders each 20 (different) levels down, or whatever.

4. If the system ever locks up and tells you to use FOLDR100.PRG, then you probably should.

In short, POOLFIX3 actually fixes a bug which every Rainbow TOS user is exposed to; FOLDR100.PRG adds memory to an internal pool. That internal pool is really badly managed in pre-Rainbow TOSes, and much much better managed in Rainbow TOS (after you fix the bug by running POOLFIX3), but in both cases you benefit by using FOLDR100.

Why was this article posted? That information is available to all developers, is of limited interest to anyone else, and is protected by the nondisclosure agreement between developers and Atari. It's not that this particular information is all that secret, but posting it does constitute a violation of that agreement. I don't want to be a bad guy about this, but you shouldn't just key in Atari documentation and post it. Among the reasons is that you can get it wrong, or leave out important stuff, and people will complain to us about things which are not our fault.

This is bullshit. What happens is that a lot of innocents who just bought their machines three days ago and don't even know what piracy and copyrights *are* yet will get burned big by this, sure as hell.

Prevention of piracy is a never-ending process, not just a long one. You have to get the people who will listen to think about violation of property rights piracy does, as well as the complete lack of any support from any legitimate source and the very real possibility that you'll get your balls sued off if you benefit from having used the software. The ones who won't listen will get theirs; I believe in the old "Time wounds all heels" quip, though I didn't ever report pirates to the authorities. The ones who do the most damage seem to get theirs anyway, eventually. But I will do what I can to try to convince people not to pirate, and I would not permit copying of any restricted software at meetings of my old club.

Hello all,

My monochrome SM124 died (flyback) and my dealer told me that no monochrome monitors are available. Upon calling just about every dealer and mail order firm for the ST that I could think of, I heard the same story. My dealer suggested that I sell him my Atari SC1224 (a very sharp and crisp 1985 version) and he would sell me a multisync and adaptor.
Ok, first question.... does anyone have a monochrome monitor that they are not using?
Second question.... how clear is the image in monochrome mode for a multisync monitor? I use Spectre GCR daily and don't want that product to be hurt.
Many thanks for any comments...

Someone who has a Mega also wants to run Bedford Accounting (PC version) using PC Ditto II or PC Speed or SuperCharger, ...

Today, I tried running Bedford, and just like PC GEM apps, the system goes into never-never land after a few moments of operation. Has anyone else had this lockup problem or heard tell of it or am I the only one (and should I be on the horn to Michtron for support?) What could be causing PC Speed to lock up the way it does?

Does anyone on the NET have a Portfolio development kit. Care to present a summary of the package?

I need a copy of the latest version of TOS for the Atari ST, on disk. I recently acquired an Atari ST emulator for my Amiga and am dying to try it out. It requires me to put in a copy of TOS, which I don't own. Anyone want to sell me one? Please make offers through my account (E-Mail me!)

Cheapest bid gets it. I would like to get the latest version possible. Incidentally, is TOS copyprotected? If it is, I require the orriginal disk. If, by some chance, you had an orriginal, archived it then somehow destroyed the orriginal, I will accept a copy if the the orriginal disk accompanies it.

Oh yes, just as a matter of curiosity, what is TOS?

Thanks,
Rich

P.S. Boy am I desperate!!! Golly, I'm so desperate that no offer will be refused outright.

I have used a product from GfA (the makers of GfA Basic, although I am not sure if that is known here at all-I have been away from my ST for too long), that was a beta/demo version I get through PD channels in Holland. The official release was somewhere between $40 and $50 (converted, current exchange rates). I have seen it emulate a Monochrome on color, but that was really not worth your time. The color-emulation was a lot better, though buggy.

In the IBM C language Manual (SC09-1128) I read the following:
Integer constants are always positive. If you want to write a
negative constant, use a unary minus operator, as in -53. This is
actually a "constant integer expression", but the compiler accepts
it anywhere an integer constant is permitted, and it computes the
value for you at compile time. (On System/370, the expression
-2147483648 must be type cast to int to represent the negative
integer with the largest magnitude.)

2071. Lab write-ups/Scientific Plotting

Newsgroup: comp.sys.atari.st
Date: 1990-02-24 14:16:06 UTC
From: eer36024@uxa.cso.uiuc.edu
Message-ID: <46300088@uxa.cso.uiuc.edu>
Source record: 243165

I want to use my ST to produce lab write-ups from my Physics classes. However, I am not certain if the software that I require exists. I have a Mega 4, mono monitor, and HP DeskJet.

My needs are basically three:

1: I need the ability to do graphs with error bars and have one or both axes be logarithmic, and to have the program do some type of curve fit to the data

2: Moderately complex mathematical expressions should be possible.

3: Diagrams should be able to be imported. Preferably, .GEM format, but .IMG or .P?3 would be marginally acceptable.

Obviously, I need to be able to output to my DeskJet.

It would seem that my choices would be limited to TeX or Signum2 as the base of all this. Then I would need a scientific graphing/plotting program (I don't know of any for the ST) that can produce output suitable for importing into one of these programs. Or I could simply put diagrams and graphs on separate pages to eliminate the need for importing. What are TeX and Signum2 capable of importing? And what scientific graphing-plotting programs exist for the ST? Any other comments?

Thanks,

2072. TOS 1.4

Newsgroup: comp.sys.atari.st
Date: 1990-02-24 14:57:15 UTC
From: SOFPJF@UOGUELPH.BITNET
Message-ID: <9002261336.AA02042@ucbvax.Berkeley.EDU>
Source record: 243166

I Got a phone call from Atari Canada last week, TOS 1.4 ROMS are in. After some dithering, I ordered the 6 ROM set, and they arrived yesterday with some photocopied sheets. One was the blurb about Control-Drag (file move) & etc, one appeared to be only relavent to MEGA machines, and the last one was the most scary. It was a mapping of chip numbers to sockets (which chips go into which sockets), but the sokcet numbers did not make any sense in my 1040STf. I do not have H1, L0, ... nor were my ROM sockets labelled U3,6,9,4,7,and 10 (mine are U2-U7). Close examination of the old roms revealed that they were in numerical order (160-165 in sockets U2-U7), so taking a deep breath, I inserted the new ones (635-640) in that sequence as well. I found the chips harder to install than memory chips (stiffer insertion, bent a leg on one chip, got it straitened out OK).

It all works as advertised. The COPY FILES dialogue looks different, (likewise the Desktop Info, but no rainbow on my mono screen ;-). It seems the screen draws are even faster (?) than before, and certainly Show Info on a disk (even floppy) is faster. I should have done some timings before I installed 1.4, darned if I'll swap back to get them now! Nothing broke. RAMdisks are OK, UniTerm is as good as ever (Thanks once more Simon), WordPerfect is as ugly as ever, etc, etc. All in all, I'm happy. One strange thing:

I have a CLI.TOS, which used to be installed as an application to be called when I double-clicked a .BAT file. With TOS1.4, when I clicked on the .BAT file, the screen cleared, a slight pause, then the desktop came back, the BAT file was not run! De-Installing the Application (Hey could I do that before? Don't think so), and re-installing it (just re-installing it didn't help) caused all to be normal again. Had to do that on several disks. Other installed applications were OK. Curious, and a minor bother.

Thanks Alan and Co, things look good. Probably adds another year or so to the useful life of my machine. .. Oh yeah, in TOS 1.99 or whatever, maybe you can set things up so that newly-installed disk icons don't come up under an open window - it's still an unfriendly thing to do, don't you think?

P.S. Forced re-read of floppy DIR & FAT when you press ESC is OK, and necessary for people using old DOS formatted disks, but something not mentioned here (that I've seen), is that DOS 4.1 DOES put a serial number on the disk!

>
Access time is seek time plus rotational delay. I don't know exactly what RadtHD is measuring, but the larger the partition, the further the head has to move to get from one end of the partition to the other, so it only stands to reason that the average access time should increase. This is hardly a reason to call a program buggy.

This only points out the fact that overall disk performance can't be adequately measured by a single number -- it's very dependent on exactly what you are doing. RateHD measures the disk under one set of assumptions. Your mileage may vary.

2074. How do I read the joysticks in 68000 ?

Newsgroup: comp.sys.atari.st
Date: 1990-02-24 16:00:21 UTC
From: d86-rwr@nada.kth.se
Message-ID: <3022@draken.nada.kth.se>
Source record: 243168

Apologies to those in Sweden who has received this earlier.
(Did you ? Can anyone read this ? ANYONE ?)
As I did not get any answer I'm trying again, this time with eunet.

I'm having problems (ie I'm going crazy) reading the joysticks
from 68000.
I install a handler-routine in the joyvec-field of the KbVector
table given by the XBios call.
The handler routine looks like this:

```
JoyHandler cmpi.b #$FE,(a0)
beq Joy0
cmpi.b #$FF,(a0)
beq Joy1
rts
Joy0 move.b 1(a0),Stick0
rts
Joy1 move.b 1(a0),Stick1
rts
```

Now *every* IKBD-event ends up in Stick0!
Keypresses, mouse-movement and joystick-movement are all ending
up in the Joy0-routine. And nowhere else, eg bconin from keyboard
stops working. If I change the first instruction to rts, ie my
handler does *nothing*, the keyboard works.
I can't find anything in ST Internals, 68000 ST Concise Guide or
the Devpac manual to explain this.

So, where did I mess it up ?

1) How come that the comparison between (a0) and $FE always works ?

2) How come noone else handles the keyboard packets when my handler
is nontrivial, ie rts.

Any feedback on communicating with the IKBD will be greatly appreciated.

/Ronny

>
> I'd appreciate any help w/this
>
> ---jb (jfbruno@rodan.acs.syr.edu)

My guess is that it's probably either 1) magnetic fields, or 2)
assymetry in the yoke compensation magnets.
If it's the first problem, check and make sure nothing is sitting
near your monitor that could be making magnetic fields. If you move a
peripheral and your distortion goes away, that's it. If not, try degaussing
your monitor screen.
You can do this yourself if you have a degaussing coil (which you
can get at a TV repair shop) or you can bring the monitor to a TV repair
shop and have it done for you. To use a degaussing coil, first take your
monitor AWAY FROM ANY MAGNETIC-SENSITIVE MEDIA (floppies, hard drive, etc)
and place it on a large flat surface, sitting normally. Try and make the
video cable connect to it (you can move the computer too, it isn't magnetic
sensitive as long as there's no floppy disk in it). Just keep the computer
as far away as the monitor cable will allow.
Boot up and get something on the screen, and then plug in the
degaussing coil, at least 6' away from the monitor. Using a reciprocating
motion, move the coil around and slowly bring it towards the front of the
monitor. You should be making a big enough circle so that your hands go
in a path about 4' or so in diameter. bring it up to the point where the
screen is very distorted, about 4" distance or so (depending on your
degaussing coil this may be more or less), and slowly bring it backwards,
keeping the same reciprocating motion until you're at least 6' away again.
Repeat the procedure on the top and sides of the monitor. DO NOT
PERFORM THIS OPERATION ON THE BACK OF THE MONITOR! To do so would be
extremely dangerous to both you and the monitor.

If this doesn't help, then your problem is in the CRT's yoke
compensator magnets, most likely. Unless you have experience in aligning
these, I'd suggest you take your monitor to a computer repair shop, give
them the specifics of horizontal and vertical scan frequencies, and let
them do it. It can be a very difficult procedure.
If your monitor doesn't have adjustable compensator magnets, you're

out of luck. If you really want a rectangular screen, you'll have to get a new CRT (probably $200 or so).

2077. Adaptec + Seagate hard drive question

Newsgroup: comp.sys.atari.st
Date: 1990-02-24 23:04:43 UTC
From: bwhite@oucsace.cs.OHIOU.EDU
Message-ID: <1152@oucsace.cs.OHIOU.EDU>
Source record: 243171

I have an ICD host adaptor with an Adaptec 4070 controller and
a Seagate 277R-1 (?) 28ms 65meg RLL hard drive. My problem is I keep
getting a <SENSE $11> code. No bad sectors, no data errors, just the
sense $11. It happens on maybe one or two tracks on two (out of five)
partitions, but it makes me wonder if something might be wrong.
Incidentally, it's always in the same place, so that rules out
cable errors or such. Anyone know what this means? The Adaptec 4070
manual says something about an "unrecoverable data field error" or some
such nonsense, but I have yet to lose any data whatsoever, even after
performing repeated read-write-verify cycles on some of the sectors in
question.
BTW, why are all the tracks initialized to "lllllllll"...?

Well, there is one program that you could try for fairly cheap, and it just might do the trick. It is called Sci-Plot, on the Nov 88 Start disk. I would order the back issue, if possible, to get the program instructions (inside the mag). It is a very capable program, giving one access to a custom font set which includes greek letters and math symbols (one can also create a new font for a specific task). The only problem that I can see is the output to your Deskjet. I seem to remember that it can output to the printer in high or low res (??), and that the high res looks really good (on my cruddy dot matrix) it can also create a PI3 dump of the graph. Anyway, if you cannot get a back issue of that mag, email me direct, and maybe we can work something out.

Multidesk, by Codehead Software does this. It is a very well behaved program, and is one of the little necessities (USII, G+PLUS, Neodesk) that makes the ST just a little bit easier to work with.

Try STalker. VT52/ansi emulation, ascii and x/ymodem up/downloads,
great autodialer, a host of nice features, and it works perfectly in
the background with your favorite GEM application. I haven't used
anything but for ages. STalker is distributed by:
Strata Software
94 Rowe Drive
Kanata, Ontario
K2L 3Y9 (613) 591-1922
I think it sells for about $35. BBB

2086. STE documentation - why it was posted

Newsgroup: comp.sys.atari.st
Date: 1990-02-25 17:30:00 UTC
From: SOCS18@vaxb.york.ac.UK
Message-ID: <9002261405.AA03797@ucbvax.Berkeley.EDU>
Source record: 243180

This article is primarily in reply to Allan Pratt's posting questioning the reasoning behind my posting of the STE DMA sound information. Since Allan posted his complaint to the net, I'm going to post my reply similarly.

Allan, I realise that you're not "The Villan Of Atari US", and I would like to give my reasons for the posting.

1) My STE documentation was obtained from Atari UK. However, I am not a developer - I just write for a computer magazine. I am also not the only UK computer journalist with a copy of the documentation. But what did Atari UK think computer journalists were going to do with the it? Lock it away in a safe?

2) The amount of mail I received requesting that I posted the info to this group clearly indicates that this information is _NOT_ of limited interest to anyone. One of the biggest problems with writing software for the ST is the lack of correct technical information available to non-developers (i.e. the guy who is fairly serious about programming his ST, and wants the facts, but who doesn't want everything else you get when you pay to be a registered developer) I would imagine that my column in ST World would not run to six pages every issue if such information was available.

3) I agree that simply keying in Atari documentation and posting it is bad (and also a breach of copyright). Although what was posted is fairly close to the original Atari text, it is not the same. The wording is mine.

4) Since the wording is mine, I will carry the can for any mistakes or omissions.

As you might guess, I'm not convinced that posting programming information on the STE is wrong. I still intend to post some information on display hardware soon.

Regards,

Mathew Lodge

In article <25E74315.25927@paris.ics.uci.edu> wngai@paris.ics.uci.edu (Wayne Ngai) asks about loading/unloading ACCs at any time...

There are two programs that will let your load/unload ACCs--MultiDesk from CodeHead and DC Stuffer 1.0 from Double Click.

I have no experience with MultiDesk, so I can't really discuss it. I've been using DC Stuffer 1.0 for most of a year and have been pretty satisfied. The 0.9 version of DC Stuffer (demo) lets you have up 32 ACCs loaded when you first hit the desktop. For a small shareware fee (they don't really list a price; I paid $30 to register both Stuffer and DC Format at the same time), you get version 1.0.

1.0 lets you you load up to 32 ACCs upon bootup (memory dependant, of course). It _also_ lets you load an ACC at just about any time, from within any program. You can unload ACCs _only_ from the ST desktop (NeoDesk doesn't count; you'd have to quit neodesk to dump your accs). Stuffer sometimes has trouble loading ACCs that seems to be tied into the most recently accessed drive (I've found that it's most reliable on loading accs from the desktop if you the selected window is the one you're loading from).

I've heard good things about MultiDesk; I just happened to buy DC Stuffer first. I've been satisfied.

2090. Anybody play Space Ace yet?

Newsgroup: comp.sys.atari.st
Date: 1990-02-25 20:14:53 UTC
From: sbrown@bgsuvax.UUCP
Message-ID: <5463@bgsuvax.UUCP>
Source record: 243184

I was wondering if anybody out there owns the Space Ace game for the ST yet. I was a big fan of the original game and the demo for the ST version makes the game look like it has a lot of promise. I had some question for those that do own it:

1) How many disks does it take up? The demo takes one full side and thats for only a few seconds of action.

2) How much of the original video disk does the game contain? I understand if you can't answer this one. I called ReadySoft and the person answering the phone was unsure but he said that it contained about 33 scenes. This seems a little less than the orginal laser disk.

3) How does the game play? Is it smooth or difficult to control?

4) Do you think its worth the pricetag? (I believe I saw the price to be in the $50 to $60 range.)

5) A final question that has nothing to do with the ST version: Does anyone know where I can get a copy of the original laser disk?

Thanks...

If you are going to send cash why not go down to your local bank and get
the cash in the denomination of the country you are going to send it to?
Whenever I send cash to the U.S., I send it in U.S. dollars so that the
receiver does not have to convert from my Canadian ones. That way the
receiver gets his cash in a form he can use without having to worry
about things like exchange rates.

> Question: Is there a limit to the total number of files that a
>double-sided floppy disk can contain.

The root directory of a standard floppy disk is limited to 112 entries.
(7 sectors * 512 bytes/sector) / 32 bytes per entry = 112
Subfolders are limited only by disk space.

>I suspect that the 'FAT' must have a ceiling to it.

Not one that you can violate. The standard 5 sector 12bit FAT table has
space for over 1700 data cluster entries whereas a 80 track 9 sector/track
double sided disk has only 709 data clusters.

>might you also suggest a technique to trap for this disk 'error'.

You should receive a -36L DOS error code = Access denied if you attempt
to create a file in this situation.

>head has to move to get from one end of the partition to the other, so
>it only stands to reason that the average access time should increase.
>This is hardly a reason to call a program buggy.

But on a Seagate st296n with supra hostadapter, ratehd gave slower
access time on smaller partitions (and on larger partitions than 16 M). In
fact the difference to the manufacturer's specification seemed to be
smallest on a 16 Meg partition. I don't demand that ratehd reprodueces
the original spec; the readme file coming with ratehd states that this
cannot be expected. But, anyhow, I'm astonished about that *strange*
dependence which is not directly related to an obvious feature like the
number of cylinders which have to be passed by the head(s). And don't
forget that ICD claims measuring the drive independent on the way it is
formatted. In this light, any dependence like the above has to be
regarded a bug.

I can think of one: WTERM .

There are at least two programs called WTERM, and one of them is
an accessory available from the ftp site called "terminator", in
the directory "telecomm":

-rw-r--r-- 1 46592 Apr 12 02:18 wterm.arc

The distinction of WTERM is that it runs in a window.

Max J asked:
>I used to use Flash occasionally as an editor while online (before I switch
>to Uniterm :^) - thanks Simon!), but I never ran across the phantom typist
>while doing so - in fact I've never had it happen to me. I have the 85 ROMs
>and normally have some fairly minor accessories running - the control panel
>and so forth. What kind of things were you doing when it hit?

I've used FLASH as my "editor of choice" for all my ST-Log articles, my Dungeon Master hintbook, and most of my other text editing.. it doesn't have all the "bells and whistles" of the "real" wordprocessors, but then again, my applications have never required any of those features..

Essentially the same symptoms as reported by others, using other programs, occurred... I would be typing in new text at the bottom of the text buffer.. A series of quick backspaces would trigger the "phantom typist", resulting in the last 10 or so characters being repeated over and over, until the syste crashed...

It didn't happen often, but when it did, it was terribly annoying...

I wonder if Ken knows where I can buy a new supply of dried chicken blood..?

Allan Pratt asks, in reference to the posting of some technical data about the STE's sound:

>Why was this article posted? That information is available to all
>developers, is of limited interest to anyone else, and is protected by
>the nondisclosure agreement between developers and Atari.

Well, it was probably posted by someone who's tired of Atari's stupid, restrictive policies about who gets to know the details about the computers they've purchased... only the "elite" developers who've passed the intitiation rites and paid the initiation fee prescribed by Atari are worth Atari's time or effort.. (as recently noted by KenB@Atari)

>I don't want to be a bad guy about this, but you shouldn't just key
>in Atari documentation and post it.

I don't think anyone here thinks Allan (or Ken) are "bad guys" because they follow company policy... (not even *me*... would you believe it..??)

>Among the reasons is that you can get it wrong, or leave
>out important stuff, and people will complain to us about things which
>are not our fault.

OK, "people"... go ahead and write us the most incredible sound programs we've ever seen (or heard), but if they're based on the information you read here, and not on "official" Atari documentation, don't complain to Allan, or Ken, or anyone at Atari... OK..?

I searched long and hard for a *good* terminal desk accessory. MiniTerm 9.32 seems to do the job. It has very good vt100 emulation, allows for x/y/zmodem uploads and downloads, cursor positioning with the mouse, function key assignment, dialing menu and the configuration is performed by use of an editable resource file. I have used this program in conjunction with the MULTRAN background downloader and it makes for an excellent combo. Just pop up to MiniTerm, start the download, then exit and invoke MULTRAN to download and continue with what you were doing while it downloads. It has a couple disadvantages though: you must have a zmodem program to perform zmodem transfers and it does not run in a window; it just takes over the screen. I think you can get this one from GEnie or FTP, but I can't quite remember where I got it from - my brain is toast.

2104. Folder hierarchy and pathname length

Newsgroup: comp.sys.atari.st
Date: 1990-02-26 08:31:12 UTC
From: klute@heike.informatik.uni-dortmund.de
Message-ID: <2018@laura.UUCP>
Source record: 243198

In article <2051@atari.UUCP> apratt@atari.UUCP (Allan Pratt) writes:
>Most people don't open a file 40 directories down in
>their heirarchy, or two folders each 20 (different) levels down, or
>whatever.

Hmm, is that really possible? I once tried out how deep a file could be nested in the file system hierarchy. From the desktop I created a folder "1" in the root directory, then a folder "2" within "1" and so on. I ended with folder "8" and got a message which told me that it is not possible to create a folder so deep in the index structure. To open a file 20 or 40 levels deep in the file system should not be possible.

Now you can calculate the maximum pathname length: 3 (drive id, colon, backslash) + 8 (max. folder nesting) * (8+1+3+1) (basename (folder), dot, extension, backslash) + (8+1+3) (basename (file), dot, extension) + 1 (string terminating null character) = 120.

Many (most?) programs do not care for pathnames of that length. For example I got 1st Word Plus to bomb out when I tried to open a file "D:\11111111.111\...\88888888.888\TEST.DOC". Probably the internal pathname buffer is to small and longer names overwrite other data. My Laser C documentation says that a 64 byte buffer for the dirname portion of a pathname is sufficient. However, I do not know what the official Atari developer's documentation says.

Any comments?

Subject: STE Questions.

Please could somebody tell me the pinouts of the SIMM Sockets as used on an STE
I wish to interface a 2Meg memory board straight into 2 of these sockets rather
than using the standard Memory modules.
Alternatively does somebody know the type number of the SIMMS that are supposed
to be used (Both 256K*8 & 1M*8 if possible)
Thanks for the trouble.

Up till now the main problem i have had software wise with my STE is that
CUBASE V1.0 Doesn't work with the mouse!!!!
It seems to be usable with the keyboard (Alternate & arrows e.t.c) but when i
attempt to use the mouse a continuous clicking noise is produced upon moving it.
I have tried replacing the mouse driver with a new software one but with no
luck. Does anybody know of a fix to this mouse problem???????

Thanks for the help,
Kevin Cooper

Please reply via E-Mail if possible to:
cooper@miduet.gec-mi-at.co.uk

P.S. I think the STE will be great when some software is available!!!

>used.

I have just got a Hard Drive after 3 months of waiting for Power
Computing to come up with it (just thought I'd add that dig). Now that I
have all this disk space the 40-folder bug must be more likely.

Can someone explain exactly what causes the memory to be used up. Is it
creating folders/opening folders or both? I have installed foldr100 but
I'd like to have some sort of empirical measure of how long I can muck
around with my drive (setting it up etc.) before I should reboot.

Also, what are the symptoms of the bug? Does the machine crash or would
things like having several copies of the one file (with the same name) in
the same directory be a possible consequence? This happened to me last
night but I wouldn't like to jump to conclusions - I'd been compiling a
C prog which refused to do anything but bomb out, but my ST kept on
going (it didn't lock up) so normally I would have thought that was the
cause.

While I'm on the subject, what does *one* bomb mean? Neodesk didn't know
and either did any of my books....

I'd keep cash payments in dollars only. It is very difficult for the
average Joe here in the US to either get foreign cash or to change it --
unlike in Europe, where every bank will do both buy and sell foreign
currency. Only the bigger banks, airports, big-city banks will buy and
sell foreign curency in the US (my experience in the Boston area)
without a lot of hassle.

From: hcj@lzsc.ATT.COM
Message-ID: <1330@lzsc.ATT.COM>
Source record: 243057
Cross-posted to: comp.sys.atari.st,comp.os.minix

In article <22392@pasteur.Berkeley.EDU>, anton@sting.Berkeley.EDU (Jeff Anton) writes:
> I have a new 40Mbyte Supra hard disk drive for my Atari ST 1040.
> The machine is a few years old with TOS in ROM.
> MINIX ST 1.1 doesn't recognize the drive. I've tried several
> approaches includeing running MINIX from GEMDOS with MINIX.PRG
> and MINIX.IMG generated from the boot disk.

1. It is not clear if its you or Supra that has a problem.
2. If you; Minix 1.1, as shipped expects to find a minix root partition
at partition 2.
"
/* Get size of RAM disk by reading root file system's super block.
* First read block 0 from the floppy. If this is a valid file system, use
* it as the root image, otherwise try the hard disk (RAM_IMAGE).
*/
#ifdef ATARI_ST
printf("Booting MINIX-ST 1.1. Copyright 1988 Prentice-Hall, Inc.\n");
printf("Insert ROOT diskette and hit RETURN (or specify bootdev) %c", 0);
root_device = (dev_nr)getdev();
if (root_device == 0)
#endif
"
So, It is assumed that you first boot MINIX from a floppy. At this point
you can prepare a partion, 2 being preferred for minix.

3. You can test if you have basic communication with the HD, from MINIX,
by reading section 0, which is the boot sector, and partition 1, which is
(I assume) TOS.
dd if=/dev/rhd0 > /tmp/hd0 should not fail.
tos -d /dev/hd1 should print familiar information on TOS c:.
If either or both FAIL, then you have INTERRUPT problems.

4. Remember TOS is polled IO, not INTERRUPT. You would never no if disk
interrupts failed under TOS. MINIX only uses INTERRUPTS. Assuming that
the 1040 is not bad (Try someone elses HD); its a Supra problem.

5. Supra had three vintages of Atari interfaces. OLD (Never would run MINIX),
Medium (could run minix with a Supra supplied software change), and NEW
(as in with fan, and DMA OUT connector) that did work.

> Ron,

The floppy ROOT directory has 112 entries in it. Each can, of course, be a directory. Each of these is limited by the number of fat entries, which is to say the storage on the disk. A 720 K disk has about 720 clusters and if you assigned 700 directories (no files) you would surely fill it up.

I suspect its the 112 limit that you are confronting.

From: saj@chinet.chi.il.us
Message-ID: <1990Feb26.162623.437@chinet.chi.il.us>
Source record: 243059

I have a couple of requests for information (maybe 3).

Has anyone seen a STacy offered for retail sale in the USA?

Has anyone seen a Mega ST offered for sale with TOS 1.4 as original equipment?

Would someone who knows more details about the Spectrum picture format than are given in the Baggett image formats list please explain the handling of palettes to me a bit more. What I get from the list is that the image data looks just like a low rez screen, but that 3 palettes are loaded for each scan line; the palettes are somewhat abbreviated. What pixel number does each palette take effect at? Are these regular 16-word-long palettes? If the docs with the package are good enough, I might buy it just for the docs, but with my lack of artistic ability, another paint program is the LAST thing I need.

I guess replies to the net are appropriate for the first 2 questions; mail or posting, your choice, for the third.

Thanks. Steve J.

Please post/summarize any mail responses you get. I have been doing a little midi programming myself in GFA BASIC and Sozobon C. As far as I have been able to determine, the best timer resolution you can get in those languages is 200 Hz, which seems pretty marginal to me.

Source record: 243061

OK, so I just bought an Atari 520ST, and it didn't come with any documentation other than a "getting started" book, so I know very little about it. So please bear with me if this seems like a simple question, or has been covered before....

The 520ST has a hard disk port, but I can't find anywhere what kind of hard disk it's supposed to attach to. I know that one can, somehow, attach a SCSI disk to the ST. I have a Micropolis 85Mb ESDI drive that I'd like to attach to my machine. Using an Emulex MD21 adapter, I can make this look like a SCSI drive. What other pieces would I need to attach this drive to my machine, and where can I get them?

While I'm at it, are there any good books describing the internals of the ST? I've been to just about every computer bookstore in the city, and even a few outside the city, and none of them carry *anything* about the ST.

Thanks,
--Pat.

2118. ST C programming

I have some one year C source that I d/led from GEnie that gives
some great examples of ST GEM/AES/VDI programming. I am contacting
the original author to get his approval to post them here on cs.atari.st.

Are there any other C ST programmers out there on the net who would like
to see more C code posted?? I am interested in such code myself.

One of samples that I got from GEnie were some functions to give you
floating menus (i.e. menus don't appear at the top of the screen, but
can be moved around the screen). There were some others to do customized
alert boxes etc. the old samples that I got from GEnie only worked in
medium rez. But I will try to get them working in hi rez.

Well, what say folks??

I think that there is a limit of 100 objects (files or directories) at the top level. I seem to recall, however, that in a sub-directory, there is no such limit. On the other hand, there is another limit that may get you: my experience is that each file consumes at least 1K of space, no matter how small it is. I think this means that a floppy formatted with 709K bytes will be limited to 708 or so files, 99 at the root level, and the rest in a sub-directory. I have never tried to pack such a disk, has anyone else?

Here is an article I wrote for or user group's (NAVAUS) newsletter last year, it should answer your question.

GGGG
GG GG
G
G
G GGGGem Alert
GG GG
GGGG

Gem Alert, by Ray Wallace

As you probably all know GEM allows you to create folders (subdirectories) to place some of your files in. This article will describe some of the folder and file limitations inherent in GEM.

The top level (root) directory is limited to a maximum of 112 (256 for hard disks) files (directories are counted as files here). This restriction exists because the top level directory is created with a FIXED size when the disk is formatted. (NOTE:Disk formatting programs can be written to change these limits).

Subdirectories on the other hand can grow as need, so there is no limit on the number of files that can exist in a subdirectory. Subdirectories are really just specialized files, and just like other files can grow in size so can subdirectories. One limitation to subdirectories is that they can not shrink, in the sense that when you delete files (directory entries) the subdirectory does not get smaller.

On top of all of this there is also a limit to the maximum number of files a window will see. If you have more files in a directory than this window limit then you will not be able to see (or access) all of the files in a particular directory or subdirectory, regardless of how you scroll around with the scroll bars.

As far as I know, there is a store here in Houston, TX that sells the Mega2's and Mega4's with tos 1.4 and blitters installed. I am not sure whether they install the chips at the store or if they are shipped with them. The store is called THE FLOPPY WIZARD, Memorial City Mall, Houston. I don't know the exact address offhand...

>[...]
>P.S. Boy am I desperate!!! Golly, I'm so desperate that no offer will be
>refused outright.

What you are asking is at worst unlawful and at best a violation of nondisclosure agreements between Atari and its developers. TOS-on-disk is not copy-protected, but it certainly is copyRIGHT protected. It is further protected as a trade secret. It was only available to developers, and they're all (nominally) bound by a nondisclosure agreement with Atari. (It goes both ways: Atari doesn't sell or otherwise divulge THEIR work-in-progress, either.)

I guess there's no harm in buying an ORIGINAL RAM TOS disk (circa 1985), as long as the seller doesn't keep a copy for him/herself. That was a product for sale, and I don't think it was covered by any license agreement, certainly not one saying you couldn't resell it.

I'm not giving legal opinions, only guesses. I don't speak for Atari. (Well, on RARE occasions I try to, but it almost always ends in disaster.)

Stan:

Thanks for your input on the XEP80. I have a few questions about 80 column drivers:

- Can the XEP80 display crisp 80 column text on a 13" color TV?

- Can the XEP80 display ATASCII graphics (the ATASCII character set) On a mono/amber screen monitor? (Or if I were using an XEP80 with a mono monitor, would I need to use ASCII translation when modeming?)

- There is a PD 80 column driver I am sure you have seen that sets up 80 columns o the screen. But this won't work with, say, BOBTERMwill it? Upon loading of BOBTERM wouldn't the 80column handler cause some sort of crash??

Thanks!!

a desktop screen using ALT-HELP command. Is there anything I need to
adjust? If so, what?? Any help is appreciated!! Thanks!!

wngai@paris.ics.uci.edu

You need to get a program called PRTST24 written by Dan Wilga of
Gribnif software. (These are the people that sell NEODESK).

You can get this program from GEnie (which is where I got it and why I can't
post it to USENET) or you can order Gribnif's PD disk for $10 and get it.

ps. I downloaded several programs from GEnie do solve this problem, and
PRTST24 is by far the best of the lot.

If you could make it less disruptive to other programs, we would really have
something! This is the best looking screen saver I have seen for the ST, but
it is not tolerated by many good programs. Someone please fix it!

>all secret. Still, except for blitters, etc, the general chip
>set is the same (I presume) so the 520ST schematics might be
>a good starting off point for other versions.
>
Actually, Atari really diversified with chips. I've seen several different DMA chips and floppy controllers (anybody else have a VLSI1772 FC, as opposed to the "standard" WD1772?). All the chips are not 100% compatible, either... Actually, I can't say that with 100% certainty. My first DMA chip refused to work with Spectre 128/ICD/Seagate 251/Adaptec 4000, but worked fine with everything else. The "new" DMA chip (actually an older model) worked fine with that setup, but *something* is mighty unhappy when I try to use a Seagate 296N with an ICD host adaptor and a Conner CP340 with a BMS200 HA online at the same time. (yes, the SCSI IDs are not the same)

There are also four? versions of the blitter chip.

Plus, there's this new talk of SIMMs or SIPPs (SIPs?), depending on which is cheaper...

Message-ID: <1990Feb27.001037.22445@ux1.cso.uiuc.edu>
Source record: 243075

I would like to write a program that scans my hard disk and maps out bad sectors (even slightly bad). Does anyone know how to a) detect a sense code from the ICD controller or b) make it so that a write/read error doesn't pop the dialog box onto the screen? Will it pop if I am using rwabs? How about read/write()?

Is there already a PD program that does this? Thanks.

I don't know how to shorten the time (or lengthen it), but I have another suggestion: make one of the screen corners be the `start right now' corner, and another (possibly configurable) be the `don't start' corner. Move the mouse into one corner, and the screen-save starts right away. Move it into the other (and leave it there), and the screen saver won't start up until you move it out of there. (Not my ideas, just the way I've seen other screen-savers work.)

From: bmaraldo@watserv1.waterloo.edu
Message-ID: <1254@watserv1.waterloo.edu>
Source record: 243079

What a wonderful set of back-up programs! I am refering to the recently posted Vault and Key programs. The Vault workes wonderfully, packing diskettes completely. The Key, ont he other had, didn't work all that well. The first time I tried to unpack my 'vualted' disks the hard drive sat there cratching in the middle of my C:\TEX\TFM folder. I tried again it there wern't any errors but the C:\TEX folder was not there even though The Key said it wrote the relevant files. I did a 'Show Info' on C:\ and it acknowledged the space that should have been used up by C:\TEX (about 5 meg was missing!). So had to zero the drive and manual load the files, sigh! I'll try another back-up and see if it works, but I'll be damned if I am going to trust The Key to unpack my files (to test a full back-up I had to zero my C:\ partition; if The Key is indeed buggy then I'll have to spend hours again reloaded the drive manually).

+ As far as having to spend a couple of hundred bucks just to get
+ information on your machine, this is no different than IBM, Mac, or
+ Amiga computers. When you buy IBM and DOS, do you get a technical
+ reference manual? NO! Sure it's available, but at a cost. ThisO
+ same scenario is played out with both Mac and Amiga computers. You
+ can find information on the Atari line of computers without having
+ to become a developer. But, just as with the above mentioned
+ computers, you will have to pay for it. I wish information was
+ free, but we all know that just ain't so. Knowledge makes the world
+ go round. Not just in the computer field, but in every field.

Sure, I can get a DOS book for around $25 that details all the DOS and BIOS calls. I can get a complete listing of the Amiga kernal for about the same amount. I can buy the _entire_ Inside macintosh series for less than $150, and that includes all the hardware and evangalizing, too.

Almost doesn't seem fair. Almost wish ST people could get cheap, complete docs like _they_ can. I don't have $250 to become a developer right now. But I have about 3-4 books that answer nearly _every_ hardware or software question about the PC/AT line: total (list) cost: about $115.

I will try to be brief but I have some burning questions. I have been Atari fan since first computer...I have owned several 8-bit's...I have also been fan of ST for as long as there has been one. I regret that the computer has not been supported in America as it should. However, I am still planning on buying one. This brings me to my questions. SHOULD I WAIT FOR THE NEW ATARI STe AND TT? AND WHAT EXACTLY ARE THEY?. It is hard to get that kind of info here. I hate asking people if they sell Atari Computers and have the reply "Atari still makes computers?." Please do not send hostile replies I am truly an Atari fan (till death). And I hope sincerely that these new computers will sell in America. As for those of you who ask, I am a comp. sci. major at West Virginia University and want the computer for programming and telecommunicating. Please send replies directly to me as not to take up space on the list.
Sincerely,
James Keefover

>Can someone out there tell me what memory speed is required for the
>STe or standard ST. (I suspect 100ns) Also if I use faster memory such
>as 70ns will asyncronous tasks such as burst filling a 16Mhz
>Hypercache or DMA access will these be faster?

I recently upgraded my 1040 STf to 2.5 MB. I have now 16 256kbit chips
that are rated 150 ns on my shelve doing nothing (any takers ?). So the
answer to your first question is: 150 ns is sufficiently fast for an
8 MHz MC 68000. (Does the STe run on 8 MHz ?)

As to the second question, no, I would not expect DMA to be able to
exploit faster RAM chips. I don't know what Hupercache is, but unless
it is hardware, it can not exploit faster RAM chips.
By the way, even if it could, the improvement in performance would be
negligible, because access times for a hard disk are in the order of
25 ms. Transfer rate to the computer must be extremely slow to make
any difference.

>With the new MMU in the STe and spare/reserved bit patterns in the
>memory configuration can the STE's memory be expanded beyond 4MB. (I
>guess adding a new bank size of 8MB would be possible thus allowing
>the full 16MB of address space.) any comments?

Well, I would expect the new MMU to be an improvement over the old one.
However, the full 16 MB address range can never be dedicated to RAM,
because then there would be no space left for ROM and I/O. I have no
documentation on the new MMU, so this is only educated guesswork.

Regarding the probability that STEs will feature SIPPs if they are cheaper - excuse my ignorance but are SIPPs ram things which don't let you plug in memory chips??

If they are then a few people over here are going to be a bit cheesed-off when they buy their SIMMs upgrade for 69pounds and find they can't use them. Everyone in the UK believes SIMMs to be a feature of the machine. (Magazines, distributers, users - remember them Atari?, etc)

As I say, if that's what Mike was on about then it's OK, if I've picked up the wrong thread and he's not talking about the STE then sorreeee!

Mark.

>

While I agree with your point about many users not willing to pay for quality software, I don't think you had to jump on this guy to make it. There's nothing to indicate that he was not going to pay for a shareware product. Maybe he feels the best value is in the shareware/PD market. And asking for fast and reliable software is not asking for much!!!!

The way that I see it is that most ST owners bought their ST because of it's value (translation: it was priced lower than everything else). You will find tons of college students owning STs, and I've seen hundreds of messages from those students saying "I'm a poor college student and can't afford to pay for this piece of software. Does anyone know where I could find something comparable in the PD or as shareware?"

At first I wondered why Publishing Partner (remember that?) came out without a HP laser printer driver (I couldn't believe it had a Postscript driver!), but I read somewhere that the company felt that most ST owners could not afford a laser printer and that the Postscript driver was for the serious desktop publisher, and for their own use. If Softlogic really said that, I don't know, but that is what I'm talking about.

Maybe this is why the ST has trouble attracting the big name software developers. They know that someone who paid $600 for a complete system won't pay $300-$500 for their software.

Mathew Lodge says:

>1) My STE documentation was obtained from Atari UK. However, I am not a
>developer - I just write for a computer magazine. I am also not the only UK
>computer journalist with a copy of the documentation. But what did Atari UK
>think computer journalists were going to do with the it? Lock it away in a safe?

I think Mathew has hit on one of the main reasons why the ST sells
better this side of the atlantic. Since Atari UK, Germany, ... etc.
release information to mags to aid in producing articles they get lots
coverage (free advertising.) It is worth noteing that Atari actually
advertise more in the US than here! (I have only ever seen one Atari
ad in a UK publication in over a year and a half!)

>As you might guess, I'm not convinced that posting programming information on
>the STE is wrong. I still intend to post some information on display hardware
>soon.

I too will take alot of convincing that this information should not be posted
to the net, If you can read it in a magazine then why not on the net?

Source record: 243087

Hi All,
I'm having trouble with transfer from the VAX (running VMS 5.2) and my 1040 ST (using Uniterm V2.0e 002). I've tried both xmodem (I don't know the version number on the VAX) and VMS Kermit-32 version 3.3.118.

I am able to send files from my ST to vax, But I can do the reverse. With both methods I get disk write error just before it is complete. According to the transfer screen, it transferes, but the file doesn't get written to the disk.

I was able to do this with the school's AT&T computers, but not my own. If anyone has any ideas, please either post them, or e-mail me direct.

Thanks (in advance).

>to restrict the information even further.

Sorry, that line of reasoning seems retarded. I understand that Atari cannot afford to give away disks and manuals and software. And if developer information includes advance notice of corporate strategy (e.g.: notice of pending new products), then yes, Atari must ask for some restraint. They deserve it, in that case.

But what was posted hardly warrants any concern from Atari -- if anything, they should be happy to see such information spread to the four winds. No one at Atari had to type it up & post it, nor pay for distribution. If it makes a feature of their product line more accessible, then what in god's name is the harm in that? So what if someone propagates the information and doesn't dot their i's correctly? It's regrettable, but hardly a tragedy or legal liability for Atari. What do you think disclaimers are for?

> As far as having to spend a couple of hundred bucks just to get
>information on your machine, this is no different than IBM, Mac, or
>Amiga computers. When you buy IBM and DOS, do you get a technical
>reference manual? NO!

Neither do you have representatives of IBM, Apple or Commodore chiding people for telling others how to program their machines. Not for giving *incorrect* information, mind, just information.

What was posted wasn't source code. It didn't cause a loss of whatever competitive edge Atari may have. I'm not flaming Kevin Clendenien, and Atari may have the legal rights to build fences around anything they damn well please, but it sure seems dumb in cases like this. What, are they in business to sell hardware or developer kits??

> Sure it's available, but at a cost. This

2146. Keybaord clock: Software needed!

Newsgroup: comp.sys.atari.st
Date: 1990-02-27 17:07:08 UTC
From: tmwhitehead@miavx1.acs.muohio.edu
Message-ID: <1061.25ea6d6d@miavx1.acs.muohio.edu>
Source record: 243090

A friend of mine recently gave me a clock module tha fits under the keybaord chip. He wasn't using it anymore, since his HD had a clock in it. It says micro-time on the board, and it has 2 wires that come off the board and go to a AA battery pack.

The problem:
He doesn't have the software or the manual anymore. I can't get the darn thing to set to the proper time and date, and I can't get it to set my system clock on boot-up. I have tried setting it with control panel, and I have dcclock from the archives, but it doesn't seem to work. The wierd thing is that now my time and date on power-up is different than it was before I put the clock module in. (It's still worng, but it's different.) It also seems like dcclock sometimes reads the time and date from the clock module, and sometimes it doesn't. Example. I turn on the computer, midnight, and the clock says 4:00 pm. then I turn it off until the next morning at 9:00, and the clock says 1:00 am. (9 hours later). Other times, it doesn't seem to keep time like this. (maybe I'm just missing it though.

What I really need is some way to set this clock. I think DCCLOCK will read the thing and set the system clock for me, if I could just get the clock set.

The BEST thing would be to find someone who has the software to set this closk, or the address of the company that made it, or the location of some software that might have a chance of setting this clock.

Thanks!

2147. PC DITTO II

Newsgroup: comp.sys.atari.st
Date: 1990-02-27 17:10:30 UTC
From: ericco@stew.ssl.berkeley.edu
Message-ID: <1990Feb27.171030.6687@agate.berkeley.edu>
Source record: 243091

I got PC DITTO II in the mail last week. The installation was easy.
However, it doesn't work.

The software indicates that the board is not properly connected. Does
this message indicate that the new chips are required.

You can get AMCGDOS.ARC from terminator.cc.umich.edu (35.1.33.8).
This seems to be a PD version of GDOS. I believe there is also a file called
GDOS.ARC, but it just has a text file explaining GDOS, not the binary. There
are a couple of GDOS fonts also on terminator. I believe that the _real_
Atari GDOS is not public domain, but AMCGDOS is.
Hope this helps.

No one is likely to end up in jail over this, but I should point out
that in many countries, it is illegal to send cash through the mail.
The intent is to remove most of the incentive for mail theft.

2151. Turbo16

Newsgroup: comp.sys.atari.st
Date: 1990-02-27 17:35:42 UTC
From: hyc@math.lsa.umich.edu
Message-ID: <11193@stag.math.lsa.umich.edu>
Source record: 243095

Well, I finally have Turbo-16 installed in my ST. Now I'm really cruising, as they say... I've only played with it for a few hours, so I don't have thorough impressions of it just yet. The Alcyon compiled dhrystone benchmark said 1300 dhrystones. I lost my list of figures from other machines, so I have no idea how this compares to other systems.

Things that don't work, or don't work right - I get all kinds of glitches when the blitter is active. In lo-rez, the screen is perfect. In hi-rez, glitches are pretty rare, though rubber-band boxes always leave trash. In med-rez, rubber-band boxes leave trash, menus leave trash, text is distorted or shifted, etc... Consider two bit-planes of med-rez screen where on a character-by-character basis, a cell is drawn some number of bytes right, or shifted some number of lines down. It looks pretty funky. (White characters get split into green & red components, etc.) Whole fields of screen memory get right-shifted a few columns, particularly during scrolling operations. Intense mouse (interrupt?) activity really drives things nuts, and can cause a lock-up in both hi and med rez.

Falcon doesn't seem to like the cache. About 5 seconds after I get off the runway, the engine literally explodes, all by itself, and the entire damage panel lights up in red. Every system on the plane is trashed, and depending on how fast you were going, you crash into the ground a few seconds later. It's quite perturbing. It always marks you down as Colonel level, no matter what you selected at the beginning.

Those were the only things that really bothered me. Airball didn't work, but now that I think of it, that change happened when I got TOS 1.4 installed. Gauntlet II died trying to read its protection scheme. Tetris worked, but I don't need to play an *accelerated* game of Tetris, thank you. Vindicators worked, but it seemed a tad fast as well. Dungeon Master works great, though it's a little disconcerting to have monsters attack so quickly. (But it's kind of a kick to watch your lightning bolts and fireballs zoom off twice as fast as they used to...) All-in-all, this doesn't seem to be the smartest thing to get if all you wanna do is play games on the ST.

A brief run-thru with QuickIndex 1.5 showed CPU-memory access was 135% of normal, CPU operations were around 203% (Gee, *more* than twice as fast! How is this possible?? }-) Ya better not blink when you go thru the BIOS text tests, 'cause you'll probably miss 'em. (With TurboST active as well, text literally flies right by. Wipe-on, Wipe-off, it's gone. Neat. }-) Pretty nice effect, overall. Since at this moment I'm still suffering from pre-break school-crunch, I don't have enough time to delve further just yet. But I expect to see wonderful things when I sit down to hacking RSN....

Oh, oddly enough, blitter behavior is slightly less erratic when Overscan
is active. (Works fine... The WordFlair demo looked very slick in that light,
a nice large screen doing GDOS-based output as fast as you'd expect of plain
text. Uniterm clips along real well too...) [Ok, ok, I admit, I was up late
last night playing with this stuff instead of studying for my exam.... It
was an easy exam tho! }-)]

Ok, so, next time someone around here mentions "speeding up arc" or "fast
compression routines" I'm gonna say "$300 - get a Turbo16." }-)
(Just kidding. The thing about going fast is ya always wanna go *faster*)

RateHD's results are not always constant. The defragger did not make any dif-
ference, as RATEHD goes to low-level sector seeking, totally ignoring GEMDOS.
Try running it several times and see what happens.

I doubt DLII could change any hardware... :-)

Sorry you had problems with The Key, but I can't imagine anything The Key is doing that could cause the problems you describe. The Key doesn't do any fancy buffering like The Vault does. It is basically just a file copy program that uses the standard GEMDOS calls to create the files. The only thing special that it does is to look for long files that The Vault has split into pieces and put them back together again.

I can think of one possible explanation for your problems, assuming you are still running TOS 1.0 or 1.2---the so-called "40-folder bug". What happens in the old TOS is that every time a folder is "touched", some memory is allocated from an internal memory pool and never released (until the disk is ejected, in the case of a floppy). A folder is touched when you display it contents or search through it (or possibly even when you display its name -- I'm not sure about that). In any case, the internal pool is only large enough to safely accommodate 40 folders. When the pool is exhausted, the old TOS doesn't report an "out-of-memory" error but begins overwriting other memory, which leads to all sorts of weird errors, including trashing your disk. Using FOLDRXXX.PRG increases the size of the memory pool but does not fix the bug. Thus, FOLDR100.PRG adds memory for 100 folders, so now the problem may strike after you have touched 140 folders.

Even if you do not normally run into this bug, you are likely to encounter it when rebuilding your hard disk, because that is one time when you touch every folder on the disk, and even worse, you are also

touching a lot of copies of those folders on the backup disks. I recall similar things happening to me a few years ago before I had TOS 1.4 when I tried to rebuild my hard disk. The "cure" is to rebuild the disk a piece at a time and reboot after each piece. Also, be sure to run FOLDRXXX.PRG with a large value for XXX each time you reboot. With these precautions, you should be able to rebuild your disk successfully. The same applies whether you use The Key or do it manually---the problem is in the old TOS, not with The Key.

By the way, I vaguely recall that one of the manifestations of the 40-folder bug is that files or folders would seem to disappear but would reappear when the machine was rebooted. Thus, if you do encounter such problems again, it is probably worthwhile rebooting your machine to see if the files come back before zeroing your hard disk and starting all over again.

Please let me know if you continue to have problems with The Key even with these precautions.

This is an empty threat. It is in Atari's interest NOT to further
restrict information -- so it won't happen.

Atari representatives are just trying to delay the inevitable -- the
word of mouth, jungle telegraph spread of useful information. They have
no hope of ultimately supressing it, and they have no legal basis to
supress it in most cases -- regardless what they claim.

One does not "get" GDOS, one receives it (beware of anything like this!).
It is included with any program that uses it. The first thing one does with
such a program is replace GDOS.PRG with G+PLUS.PRG. G+PLUS is a better GDOS,
which does not slow down the machine, allows one to select ASSIGN.SYS files,
and does not screw up non-GDOS apps like the original atari GDOS does. It is
a comercial product (G+PLUS), and costs about $35.

2158. Cheapest way to hook a SyQuest to a 1040ST?

Newsgroup: comp.sys.atari.st
Date: 1990-02-27 22:02:44 UTC
From: jfbruno@rodan.acs.syr.edu
Message-ID: <2268@rodan.acs.syr.edu>
Source record: 243002

What's the cheapest SCSI SyQuest drive anyone has seen for the 1040ST?
Is it possible to by a device to go from Atari DMA <--> SCSI and use
one of the SyQuest drives advertised in MacWeek? They go for about
$650-700 (US). I think Atari DMA <--> SCSI goes for about $90 (us).
I realize that Mac SCSI is not the same as the SCSI standard, does this
matter for this application? Would I be able to use it with Spectre GCR,
SuperCharger, etc...? A SyQuest really seems the way to go for using all
of these emulators, especially when I see how many hassles people are
having when they try to set up several different partitions on their hard
drive. I'd like to have a seperate 44MB cartridge for each environment.
Cartridges are only around $80 each.

I will summarize and post if people email me at jfbruno@rodan.acs.syr.edu

Thanks,
---jb

> Almost doesn't seem fair. Almost wish ST people could get cheap, complete
>docs like _they_ can. I don't have $250 to become a developer right now. But
>I have about 3-4 books that answer nearly _every_ hardware or software question
>about the PC/AT line: total (list) cost: about $115.

I have 2 books which tell me just about every software question I've
had about the ST. Cost? $45. Sometimes I think I live in a different
universe from everyone else. If you buy a copy of Mark Williams or
Laser C, you get an excellent GEM manual. You can also mail-order
books about GEM if your dealer doesn't carry them.

So what's the complaint? I keep on asking what people don't like about
current ST books. I haven't seen (yet) a single person who has
actually read the 3rd edition Abacus GEM book, or one of the other
good GEM books, and thought that it had lots of errors. Although some
dealers don't carry them, they are available mail-order, and you can
find ads for them in magazines.

Where's the beef?

You need what is called a "Host adapter". This interfaces Atari to SCSI.
For your ESDI drive you need also to get an Adaptec xxxx SCSI-ESDI adapter.
Thes following folks make a Host adapter (BMS-200) and are willing to talk
to you (well they talk to me!). Call or write them to see what they
recommend.

You can't buy gdos. A software product that uses it has to BUY it from
ATARI, and put it on a disk for you. Once you buy one program with it
it available for everything else.
-- I bought Dollars & Sense, and got gdos1.0. AND they only can print
using using gdos 1.1.
-- Then I bought a CAD program and it had gdos 1.1.

There is a gdos clone, called G-PLUS. about $40.

>Hmm, is that really possible? I once tried out how deep a file
>could be nested in the file system hierarchy. From the desktop [...]

The desktop imposes (used to impose) limits; I can't remember if they were removed for TOS 1.4 or not. But those were definitely Desktop-oriented, and not limits in the filesystem. There are NO limits in GEMDOS, except those already discussed -- the fixed pool from which to allocate directory descriptors. When you expand the pool you push that limit farther away, and theoretically you could add 3.5MB or so on a Mega 4 before really getting in trouble.

GEMDOS never *constructs* pathnames, so it doesn't have any buffers or anything (of limited size or otherwise). When you do a Dgetpath, *you* supply the buffer, and it had better be big enough. There's no way to tell in advance how big is "big enough," but I would choose 128 or 256 bytes.

2168. Fine scrollin'

Newsgroup: comp.sys.atari.st
Date: 1990-02-28 10:30:20 UTC
From: stefan@spcc386.UUCP
Message-ID: <592@spcc386.UUCP>
Source record: 243012

Almost a week ago (I have been out of the office some time), David Clear posted a source that does the 'Sync Scrolling'. I just had a look at it and I must say I am a bit sceptical about it. This Overscan stuff is VERY sensitive and for different MMU/Shifter versions you will need different routines. Some ST's have an upper border of 16 scanlines and others have 32 (give or take a few). I haven't tried the code yet but my bet is that it will work on some ST's and fail on some others. (But since I haven't tried it yet, I am not 100% sure on this)
The stuff I have first finds out how many scanlines the upper border actually has and sets a flag that the overscan code uses.

David asks for fast games using this technique, well I can say that the German software house Thalion that employs the guy that invented sync scrolling and some more VERY (EXTREMELY) talented people is busy working on some very technical games that use Sync scrolling. "Leavin' Teramis" which has been designed by a friend of mine (Richard Karsmakers, co-conspirator of ST NEWS), is one of them, a scrolling shoot-them-up and should be out very soon.
Thalion is also doing a 3D game ("No second prize"), which makes every other 3D game look pathetic. It is written by a guy from Switzerland and when Jez San beheld the demo at the PCW last year, he became very silent...

2169. STE Questions.

Newsgroup: comp.sys.atari.st
Date: 1990-02-28 10:34:57 UTC
From: cooper@gec-mi-at.co.uk
Message-ID: <1990Feb28.103457.19074@gec-mi-at.co.uk>
Source record: 243013

Subject: STE Questions.

Please could somebody tell me the pinouts of the SIMM Sockets as used on an STE
I wish to interface a 2Meg memory board straight into 2 of these sockets rather
than using the standard Memory modules.
Alternatively does somebody know the type number of the SIMMS that are supposed
to be used (Both 256K*8 & 1M*8 if possible)
Thanks for the trouble.

Up till now the main problem i have had software wise with my STE is that
CUBASE V1.0 Doesn't work with the mouse!!!!
It seems to be usable with the keyboard (Alternate & arrows e.t.c) but when i
attempt to use the mouse a continuous clicking noise is produced upon moving it.
I have tried replacing the mouse driver with a new software one but with no
luck. Does anybody know of a fix to this mouse problem???????

Thanks for the help,
Kevin Cooper

Please reply via E-Mail if possible to:
cooper@miduet.gec-mi-at.co.uk

P.S. I think the STE will be great when some software is available!!!

2172. Calling callgulam from TC

Newsgroup: comp.sys.atari.st
Date: 1990-02-28 11:11:16 UTC
From: av74381@korppi.tut.fi
Message-ID: <11368@etana.tut.fi>
Source record: 243016

I have been developing a Turbo-C program which will transfer
usenet articles to my BBS. They are received as packets which
are archieved using zoo. Host will send them using zmodem.

I decided to do the receiving using my humble servant Gulam.
Gulam would start zmodem at receiving end and then extract
articles from zoo.

Unfortunately have not been able to call gulam from a Turbo-C
program. I have tried out Michal Jaegermann's method for
MWC but it does not work out for TC. If anyone has figured out
how to call gulam from TC, please e-mail me how to do it.

I just do not understand why my example works for MWC but not
with TC, it gives me two warning messages when I compile it:
Call to function with no prototype in main. Lines where
I get the warnings are those where I call gulam (* gcp) ("command");.
When I try to run the program It prints out "-Start of test-" and
then comes out two bombs (bus error).

----------This is what I tried out with Turbo C ----------------

```
#include <stdio.h>
#include <stdlib.h>
#include <tos.h>
#include <string.h>
#define SHELLP ((char **) 0x04f6L)
#define G_MAGIC 0x0135

int main()
{
long save_ssp;
short sh_magic;
char *tgptr; /* storage for togu_ */
/* if you really would like to have it right, then */
/* tgptr should be a pointer to void - */
/* a bit of overkill on ST :-) */
int (* cgp)(); /* pointer to callgulam() */
/* also contains togu_, but */
/* a type is different */

fprintf(stderr, "Welcome to callgulam demo.\n");

save_ssp = Super(0L);
tgptr = *SHELLP;
Super((void *)save_ssp);
```

```
if (G_MAGIC != (sh_magic = *((short *)(tgptr - 8)))) {
fprintf (stderr, "wrong magic value %x\n", sh_magic);
return(1);
}

cgp = *((int (*)()) tgptr);
printf("-Start of test-\n");
(* cgp)("echo 'executing ls'");
(* cgp)("ls");
printf("-End of test-\n");
return(0);
}
```

---------- Michal's original posting follows --------------------------

```
# this example is for Mark Williams C

From myrias!mj Thu Oct 20 15:44:19 EDT 1988
X-RN-Article: 12125 of comp.sys.atari.st
>From: mj@myrias.UUCP (Michal Jaegermann)
Newsgroups: comp.sys.atari.st
Subject: Calling callgulam - explanation and example
keywords: gulam, shell
Date: 19 Oct 88 23:47:47 GMT
Organization: Myrias Research, Edmonton

(Whatever is described below was checked for a gulam version
which identifies itself as:
xD
beta test version 1.03.04.05 121887 of
yet another shell for AtariST/TOS

Your mileage may vary!!)

As you may not know, a very popular Gulam shell (many thanks to
Prabhaker Mateti and Jwahar R. Bammi). includes quite powerful facility
to invoke gulam services from a program started from gulam. In contrast
to many others shells floating aroung this is not done by executing
the next incarnation of gulam. Instead there are provided two pointers
which provide execution 'hooks' for all gulam commands. A bright sight
is that this approach does not take any extra memory and a start-up
time is negligible. A dark side is that documentation describing this
facility is either misleading or plainly wrong. (As an aside - this
is, alas, not the only place in documentation requiring touch-up.
For this version, gulam.hlp, for example, does not correspond very well
tp reality).

This note is a kind of erratum, which, hopefuly, will help to clarify
an ensuing confusion, which seems to be quite widespread.

When you are running Gulam a TOS variable '_shell_p', at 0x4f6,
contains an address of a location named 'togu_', which is the last entry
in a 16 byte long table. The format of the table is (this is mostly quoted
from the documentation):
```

```
.long 0x86420135 / our magic number (4 bytes)
jmp getlineviaue_ / 0x4ef9,address (6 bytes)
togu_: jmp callgulam_ / 0x4ef9,address (6 bytes)
```

It clearly follows from that that magic number is located 10 bytes before 'togu_' and not, the documentation suggested, 12. What's more, the magic number should be equal *(long *)(*(char **)0x4f6 - 10), instead of a given *((long *)0x46fL - 12L), which will produce a value from an address way off. On the top of it, an actual magic number in my copy of Gulam is not like the documented but it equals 0x00420135. Use Gulam 'peekw' to check what you got. To be on a safe side, until the matter is fully clarified, I am using only a lower half of the magic number, which seems to be correct; i.e. short_magic = *(short *)(*(char **)0x4f6-8).

Two other items in the table are entry points to two functions 'getlineviaue' and 'callgulam'. The information given in the documentation about them is mostly correct, with a similar mix-up in a calculation of an address of entry to 'getlineviaue', like the one described above. Also, strictly speaking, 'getlinevalue' does not return anything, since it is declared as 'void'. As a side effect it modifies a contents of a user supplied buffer, copying there a contents of a command line. It would be probably more convenient if, instead of being void, it would return something useful, say a number of copied characters, but it doesn't, so we may have to live with that. Just to make our life more interesting, the other function, 'callgulam', returns 'int' - the return status of an executed command. This makes wonders to types of your pointers. See the supplied program example for to see how to cast. All of this to ensure that your C-compiler will not get totally lost. If you have a compiler which accepts the stuff in a form from an original docs - replace your compiler. Fast!
(As an aside - all this pointer play would be easier in assembler, if you feel so inclined).

While experimenting whith the program example try the following. Call 'ue' on some file, position cursor somewher down the text and stop editor with ^Z. Try some other commands and upon return to Gulam type 'fg'. Repeat experiment stopping the editor in Gulam and typing 'fg' from the demo program prompt. Don't you think that this is a nice way to run editor for your, say, Lisp interpreter?

Some things are still missing. One cannot tell 'ue', on a command line, to load a file and go to the line 247. Or there is a way and I am simply not aware of it? And I know of no way to grab a result of a command, stuff it into a variable and use it for a test of conditional script execution. Oh well, maybe in some future release...

Two other, non-interactive, ways of calling Gulam are also mentioned in docs. I did not try 'Pexec method', but attempts to execute gulam as a program with arguments, as described, produced only nonsensical error messages about 'invalid regexp' and error number -33. Can anybody shed some light on that matter?

| ...
| I have just got a Hard Drive ...
| Now that I
| have all this disk space the 40-folder bug must be more likely.
|
| Can someone explain exactly what causes the memory to be used up. Is it
| creating folders/opening folders or both? I have installed foldr100 but
| I'd like to have some sort of empirical measure of how long I can muck
| around with my drive (setting it up etc.) before I should reboot.

It is the number of directories (folders) you visit during a session
that counts. I think you will be safe if you set "XXX" in FOLDRXXX
to be a number greater than the total number of directories on your
disks.

| Also, what are the symptoms of the bug? Does the machine crash or would
| things like having several copies of the one file (with the same name) in
| the same directory be a possible consequence?

This is a problem in the operating system; but don't know if this is one
of the symptoms of the 40 folder bug. I would be surprised if it is.
Maybe someone else can shed some light on this point.

I also tried this experiment on the desktop and came to the same
conclusion. However, Mr. Bammi pointed out to me that there is
a limitation imposed by the desktop that is not imposed by TOS.
So, I tried the same thing using a Gulam shell. I got over 40
levels deep.

2175. DMA Programming... DLII-Boot Read

Newsgroup: comp.sys.atari.st
Date: 1990-02-28 12:29:40 UTC
From: cs325ec@ux1.cso.uiuc.edu
Message-ID: <1990Feb28.122940.2051@ux1.cso.uiuc.edu>
Source record: 243019

Does anyone know how DLII accomplishes the reading of boot sector
0 of a hard drive? Must this be done in assembler, or can I do
it with Turbo C?

Also: if I change the partition info on the boot sector and reboot, will everything
conform?

Also: I noticed that ICD allows more than 4 partitions/drive
by turning to $156 offset after filling those starting
at $1c6... is this OK and compatible with everything?
Some program, I forget which, says "Unable to read boot
sector" when accessing partitions beyond F:. This is
with two mac partitions in between E and F also.

Thanks... Can anyone send me some source code which will read
a logical sector from the hard disk through ICD/DMA?

-Greg

The PUBLISHED manuals (available at book stores) are quite sufficient.
Often you can find what is needed at the public library - for free.

Why does Atari make such a big stink about this? They sell you machine
than they want to turn around an sell you the (expensive) manuals need
to use it!

This limit of 8 folder levels only applies to the desktop. The GEMDOS file and directory functions have no such limit. You can see this if you try the same procedure as above from a shell (eg. gulam).

According to messages that Avant Garde has posted on Genie, it probably means that the connector really is not properly seated on all pins.

AG says the only way to really know you have good connections is to do a continuity check of each pin. All reports that I've read on genie indicate that it's a pain to get seated. If you verify all pins and it still doesn't work, I'd suspect the PALS. You can mail them to AG or send them email on genie if you have an account. Good luck.

I'm still waiting on my PCD III. When did you send your card in?

Shalom, lawrence

2182. Obtaining UW

Newsgroup: comp.sys.atari.st
Date: 1990-02-28 17:46:51 UTC
From: kennyz@pawl.rpi.edu
Message-ID: <G#_#AK-@rpi.edu>
Source record: 243026

Hi... I'd like to know where I can find the LATEST version of both the Atari ST version, and the Unix side, of "uw", the Unix Windowing program. I have both right now, but there are two major problems, and if anyone has a solution, please either post here, or E-mail me.

1. Only adm31 emulation. I really need vt100 terminal emulation. This is more a wish, than a problem. It can't be THAT difficult to implement, though.

2. I have version 4.2 of the Unix side of "uw". I compiled all the files using make, and included the -DUTMP define to allow the program to record my tty's in the /etc/utmp file. Unfortunately, for some reason the windows don't show up in a "who" listing, and are obviously NOT getting written into the /etc/utmp file (and, yes, it IS world-writable.) So my only conclusion is that the version on my ST is not writing the /etc/utmp information, though that doesn't make sense to me, because Unix should be handling it. Any ideas???

Thanks in advance.

I think it would be great to see more C code posted. Especialy code fragments or small programs that show how to do some particular thing on the ST (as appose to full blown applications/games). I wish some of the ST magazines would do the same thing.

2184. HOW DO YOU BUILD A DIF FILE?

Newsgroup: comp.sys.atari.st
Date: 1990-02-28 18:45:56 UTC
From: CHIASSA@UDEM.BITNET
Message-ID: <ID6246.D900228.T144556.CHIASSA@UDEM>
Source record: 243028

I am trying to understand the structure of a DIF file so I can create files that I can read into the various spreadsheet programs for the ST. I created a small dif file and then did a dump. I can see where the data are and the fact that text is in quotes but I can't makes sense of the keywords and the values that follow. Could someone give me a brief explaination or direct me to a reference source. Any example code (C or GFA basic) would help as long as the steps are explained.
Thanks
example:

```
header1 header2 header3 <---- text fields
1 4 7 <---- numerical fields
2 5 8 <---- numerical fiELDS
3 6 9 <---- numerical fields
footer1 footer2 footer3 <---- text fields
```

```
Dump of File: TEST.DIF

2185. SCIENTIFIC PLOTTING PROGRAM

Newsgroup: comp.sys.atari.st
Date: 1990-02-28 18:55:59 UTC
From: CHIASSA@UDEM.BITNET
Message-ID: <ID6269.D900228.T145559.CHIASSA@UDEM>
Source record: 243029

B/stat by R.W. Wilson gives you very good graphic plotting features and will do outputs using GDOS but you must have GDOS, the various fonts and the printer driver that you need already, they do not come with the program. The program is shareware and available at archive-server@panarthea.ebay.sun.com. If you send in a $30 US contibution you get a excellent bound manual plus the GFA compiled version which lets you load in more fonts. The stats tests that go with it are also very good and powerful. Its has been my best shareware investment to date. As a final note you can save your graphs as metafiles, img or degas. I find this great for importing into my TIMEWORKS DTP.

2186. Problems with Laser RCP ?

Newsgroup: comp.sys.atari.st
Date: 1990-02-28 19:04:20 UTC
From: rjd@cs.brown.edu
Message-ID: <30969@brunix.UUCP>
Source record: 243030

I've been recently having a series of problems with Laser C's
Resource Construction Program - I'd like to find out
if anyone else is having the same difficulties.

Occasionally, due to a series of keystrokes and mouse
button pushes that I have been unable to successfully duplicate,
the RCP will delete my .RSC file. This can, as you might imagine,
be *real* irritating.

Megamax claims they aren't aware of this problem but will look
into it. I'm trying to figure out if
anyone else is having this problem. I am not certain, but I am
beginning to think that one of the triggers is having the
filename for the .RSC file be the same as the filename for
the .C module that accesses the .RSC file. (I know that doesn't make any
sense, because RCP has no knowledge of the .C file.)

How about it out there, anyone else experience this?

Regarding long path names. I'm pretty sure that there was at one time
a maximum length of 64 chars. for pathnames in the TOS code in a few places.
I don't know if TOS 1.4 has this limit. I haven't looked recently.

Without going into the gory details, I want to know what you programmers out there think of adding the following constraint to programming on the ST line of machines:

"You must leave Timer C in the MFP as it was originally programmed."

This does not mean you have to leave its interrupt enabled, or its interrupt vector pointing at the 200Hz handler: it just means you can't reprogram that timer's control or data registers.

If you violate this constraint, or if you think it's unreasonable, please let me know. The point is that I need a way to count small increments of real time, and I want to get rid of all the places where instruction execution time is used to achieve a delay.

If accepted, violating this constrait results in Bconout to printer or IKBD not working, and the floppy disk code not working reliably.

I'm trying to make this as transparent as possible: only really screwy programs (games, demos, etc.) care about this stuff. Timer C is the system heartbeat, and you shouldn't mess with it unless you really feel you need to, and then you should accept the consequences.

(It is already the case that revectoring or changing Timer C causes GEMDOS to lose track of the time, and AES events not to happen, among other things. Also, incidentally, if you inhibit the system vblank handler, floppy operations will never time out, and the floppy's access light will never go out even on successful operations; the motor will shut off, though.)

I don't want to make this decision in a vacuum. What do you all think?

>technique to trap for this disk 'error'. I'm using GFA 3.07
> Thanks,
> Ron,

You can have 112 files on the root directory of a floppy disk. Putting files in folders makes the number limited to free space. I'm not sure of the hard drive limit; older Supra software has a limit of 256, although I personally have seen 500 files on the root of a hard drive. The limiting factor is not the FAT; it's the directory space on the disk.

I believe fopen() (or whatever GFA's equivalent is) will return some sort of error code (negative value, possibly -49 or -36) in such a case.

Mike

```
This is the final solution to problems with bootsector viruses !!
-----------------------------------------------------------------
Put PROTECT4.PRG in your AUTO-folder, and it will check all new
disks you put in the drive for bootsector viruses. It will
protect all unprotected disks and will ask you if it should kill
the disk if it is auto-booting. Some virus killer may look at
it as an active virus because it hangs on the same vector as a
virus, and because it will and executable bootsector (which only
contains an RTS instruction) each time it tries to kill the disk.
However - With this program you won't need a virus killer. It
check all bytes off the bootsector for a certain text and should
be 1000000% safe.... Any questions - Mail to larserio@ifi.uio.no

Soon to be found on panarthea.....

You're the second person to encounter this problem this year. The conclusion
before was that the PCOMMAND shell is the culprit, because it upshifts
the command line.

2197. Re: STE documentation - why it was posted

Newsgroup: comp.sys.atari.st
Date: 1990-02-28 23:02:38 UTC
From: qralph@dna.lth.se
Message-ID: <1990Feb28.230238.18591@lth.se>
Source record: 243041

Hi,
Those on the net regularly might remember I posted appr. the same thing some time back, then derived from a German magazine, where all the STE registers where described. At the time I got, privately and publicly, exactly the same scolding from Atari USA. I had clearly indicated the source, I am a developer but still I haven't got this info from Atari Stockholm, and in general I have GIVEN them info, but never ever got a single sheet except those I got when I bought the development kit. I have sent mail via snail mail to Atari USA, I have sent several to all the Atari guys on the net, never ever a single reply. As a developer I sent in a few pages from the development package that I was requested, to Atari USA, to get something in return. That is soon one year ago. Not a single reply.-
I am also trying to sell Ataris here in town. I try to get all kinds of arguments for Atari, with the result I have sold piles of Ataris but just one Amiga (put a smiley there if you feel for it). I also try to write programs for Atari. But sometimes I wonder what I am doing. Even a fanatic might start to wonder at times...
I put the simple question to Atari USA: in the complaints here on the net there was mentioned, that this way people might get erroneous info. So my question is: What about books how to program the Atari? The deevelopers aren't allowed to tell how to do it, Atari themselves don't publish, except to people who pay $300. That means all legal books about programming the Atari are written by hackers who have guessed, experimented about everything, or possibly stolen from waste paper baskets at Atari USA. Is that the best way to inform the public about this machine???
I wish I saw some logic in the whole. Why doesn't Atari want to make money?

1. Only adm31 emulation. I really need vt100 terminal emulation. This
is more a wish, than a problem. It can't be THAT difficult to
implement, though.

Sorry cant help you here. You should be ok with a proper TERMCAP file
on your UNIX end. It provides function keys, reverse, underline,
bold, and cursor stuff just like vt100. Future versions are supposed
to include this, as the current Mac version does.

2. I have version 4.2 of the Unix side of "uw". I compiled all the files
using make, and included the -DUTMP define to allow the program to
record my tty's in the /etc/utmp file...

I have gotten both the ST and the UNIX end running also on BSD 4.2 I
just typed make all and ran uw on the UNIX-end, than went to my ST and
opened a fresh window, followed by more windows, and more windows..

I love it! It is *ALMOST* as good as X (for 2400 baud from home
that is...:-) I can finally have my gnumacs, mailer, a program compiling,
a login to a remote site, as well as an ftp session all going at
the same time and keep track at home! If anyone would be interested in
helping me add goodies to this code to include scrollbars, etc send
mail to me and perhaps we can upgrade/hack some extra goodies into the
current version of UW.

Hello,
Thank you for all your replies about what you wanted to see in a screen saver (and any other type of program for that matter). We took the most popular suggestions and put together a screen saver that we hope you will like. It is posted on Terminator in the NEW directory (anyone who would like more information on how to FTP to Terminator, please send me Email and I'll get back to you.) Terminator.cc.umich.edu
We don't have an extensive software base to test it on, but it worked well with everything we had. If you encounter any difficulties please contact me and explain the problem. We will do ourbest to ix it. The program is ARCed and is in the file called SCRN_SAV.ARC (you must use capital letters...sorry about that.) I hopits what you're looking for.

>What's the latest version, this one is 1.1.

Version 1.5.3, soon to be version 1.5.4.

>Walden's 'computer store' <here local> carries a hardcover version of the
>textbook tellin' me that there ISN'T a softbound version, this true?

True part: The generic version of `the book' on Minix, by A. S. Tanenbaum,
only comes in hardcover (at least as far as I know).

False part: There is a version of `the book' specific to the IBM PC which
is in paperback. Check "Authors in Print" at your favorite local bookstore.

I own both of these. I don't know if there are other books for other
(non-PC) architectures.

>disks.

That's true for Original TOS and Mega TOS. For Rainbow TOS (TOS 1.4),
XXX need only be the number of folders you'll have "active" at once.
"Active" folders are those involved in file searches, open files, etc.
If you open a file, the folder it's in and all the parents of that
folder are "active;" if you open another file in the same directory,
you haven't increased the number of active folders. If you close both
files, those folders aren't "active" any more, and the space they took
up in the pool will be reused when necessary.

Can anyone send source code for reading sectors off a hard disk?

NeoDesk recognizes my partitions after 4 as does DL II which can also read the absolute 0 sector, but MEMFILE and my own program SAM which uses Rwabs cannot access higher partitions than 4. I need some information please... preferably some C source that enables this activity.

Any help as soon as possible would be appreciated... P.S. I am writing an HFS partition handling transverter type program which should be done soon after I get this code. It will be shareware, so anyone interested, if you can find this code it would be most helpful.

Thanks.

From: cr1@beach.cis.ufl.edu
Message-ID: <22500@uflorida.cis.ufl.EDU>
Source record: 242904

Hi World!

I have a few questions, the first one dealing with a problem I am having with my computer. I have a 1040 ST with a tweety board, monitor master, mouse master, mono and color monitors, printer, modem, external drive. Once in a while, I'll try to boot up the computer and I'll get a 'drive A does not respond' message. I'll unplug drive B and the system will boot fine. I had this problem a few days ago, and we thought it was the cable going from the drive to the ST. Apparently, this is not it. Today, I was using my st for quite some time, doing some stuff involving lots of disk access. I turned off my computer, and turned it back on a few minutes later and got this problem. Fooling with all the cables did nothing, and it worked with drive B taken off, of course. I walked away, came back 10 minutes later and everything worked fine. What in gods name could be going on here?

Also, does anybody know of a program to control the drive speed of a 5.25 inch drive that works with Tos 1.4?

>

Keep in mind, however, that both the microprocessor AND the video
chip have to access that RAM in one cycle. I've heard that 150ns chips
can cause problems with Overscan, for instance. I don't offhand know which
I have, I think I have 150ns, but I've had erratic memory problems ever
so often, and (though I can't prove anything) I suspect it may be because
one of these chips is "not quite" 150ns. So get 120ns and be safe, at
the very least. Besides, they aren't that much more expensive these days.

> tell in advance how big is "big enough," but I would choose 128 or 256
> bytes.

huh? Dgetpath/gemdos whoever *does* monkey around in the buffer
you supply. if the buffer supplied to Dgetpath() is shorter than 32
bytes it clobbers stuff outside of it (my guess is that it has someting to do
with the fact that a directory entry is 32 bytes long) (i cant
remember exactly, but maybe you need to s/32/64/g above).

the developers gemdos documentation states that 125 is the max
path length. i guess its either obsolete or incorrect.

on a related note: gemdos(Fsfirst()) still (at T1.4) doesnt
realize that "." ".." "\" or "D:\" are directories (have attr == 0x10)
(or atleast "." and ".." should be, even if "\" is not considered to
be a subdir).

> how to call gulam from TC, please e-mail me how to do it.
>
> I just do not understand why my example works for MWC but not
> with TC, it gives me two warning messages when I compile it:

your example is correct. the reason it does'nt work from Turbo C
is that Turbo C passed the arguements in registers by default, while
gulam is expecting them to be on the stack (like the normal C stack
frame conventions). (is there a option in TC to do this??)

on a related note: the correct way to check Gulam's magic
number is to get the long at addr (*shell_p - 10), mask out the upper nibble
of the long with 0x00FFFFFFL, and compare the value against
0x00420135L. The reason for this discrepancy is that there seem to be
two flavors of gulam: one with magic # 0x86420135L and one with 0x00420135L.
This way should be a little more reliable than testing just the second
half of the magic number by testing the short value at addr (*shell_p - 8).

hope that helps,

Mmm....definitely. Its hard finding good C source code for such GEM
applications. I don't know about its distribution in the US but the UK "ST
World" magazine has a "Programmer's Clinic" section each month, usually with a
fair amount of C in it. It might be worth looking at that.

How would this C source be made available? A new group? FTP? ??
No matter to me - I'd be interested in whatever form it takes.

...[edited]...
> Does anyone know how DLII accomplishes the reading of boot sector
> 0 of a hard drive? Must this be done in assembler, or can I do
> it with Turbo C?

You can do it with whatever you please. It is nothing more than a Rwabs function call.

Rwabs normally accesses the drive as a logical device, so a read of sector 0 will return logical sector 0 of a drive. If you set the absolute address bit (bit 4, I believe), it will read the physical sector 0 (partition map) of a partitioned drive. If the drive is not partitioned, physical and logical sectors are the same.

> Also: if I change the partition info on the boot sector and reboot,
>will everything conform?

Conform to what? A trashed drive? Yes. A drive with a different partitioning scheme? No. Partitioning a drive is vastly more complex than just the values in the partition maps and boot sectors. If you don't know what you are doing, I strongly recommend good backups prior to experimentation.

>Also: I noticed that ICD allows more than 4 partitions/drive
> by turning to $156 offset after filling those starting
> at $1c6... is this OK and compatible with everything?

No. It is specific to the driver you are using. The original Atari partitioning system supported four partitions. The extended method devised by SUPRA is what you are describing, and is supported by SUPRA and ICD (I think Astra also used it). The extended partitioning announced by Atari with HDX 3 is not the same.

Brett Maraldo asks:

> What can you tell me about 16Mhz 68k retrofits for the ST?
>What is the best board in your opinion and what will it cost? What
>are the pros and cons of buying and installing a 16Mhz board?

We are running the Hypercache board by the German company pro_VME on 3 machines for more than a year. Initially we had severe problems when the Atari 68881 board was installed; there were also a few bugs in the cache logic. The company has continously improved their product and, luckily, even the most problematic machine of the three now runs very stable when the cache is switched on. The present Hypercache boards seem to be very reliable products; the only program i know which *sometimes* gives rise to problems is ICD's ratehd (only in connection with a seagate st296n, so this seems to be more a timing problem of this problematic drive). The board is not cheap (600 DM) but this price is in good ratio to quality and company support.

Speed improvement: roughly 40 % on output intensitive operation, such as compilations; 70-85 % in average. '881 library functions run typically 40-50 % faster, which is a remarkable result since in these applications the 68000 is used merely as a "controller" of the 68881, which does the real work.

I'm not affiliated with pro_VME.

I have Aladin 3.0, and am a very satisfied user. It has the 64k roms.
It supports at least the SH204 and SH205, but also other drives that I
do not know of. It runs the mac software that I need.

Unfortunately, the Aladin people were forced out of business by an Apple
lawsuit threat a few months ago. So we won't have the 128k rom upgrade.

One of the Aladin people proposed a shareware version in this group,
but hasn't been heard of since.

>Anybody have any suggestions? (come out of that hideyhole, Europeans)

Here I am. We hear some good things about the Spectre. Try to take one
with you. I suppose they'll be cheaper over there. (Yes, I'm Dutch. So is

Horse pukey!!!

Apple gives much better support and much of it is free!!

Just read the mac.binaries newsgroup. Apple is always posting
Macintosh Technical Notes there (which unfortunately ar BinHexed and
can't be read on UNIX machines!).

Just in the last couple of days Apple posted over a dozen Technical Notes
covering various aspects of System 7 and Hypercard and other subjects.

It makes me jealous to see some much technical information being so freely
deseminated!! And Atari Corp has the nerve to criticize a magazine reporter
for publishing programming notes on the STe! Geez, with Apple, you would have
seen the Mac Tech Notes BEFORE a reporter had a chance to "link" them.

Just goes to show you the difference between a REAL COMPUTER COMPANY and
A GAMES MACHINE COMPANY!!

And as far as buying Tech Books, there are hundreds of programming and technical
and self-help books for the Macintosh. Except for Turner's self-published books,
there hasn't been a new ST book published in the USA for 2 years!!

Argh!!! And Atari Corp has the nerve to criticize a reporter for publishing
notes about an Atari computer (actually the STe is better classified as a
games machine!. I don't need stereo sound for DTP!).

>Ultra Network Technologies / 101 Daggett Drive / San Jose CA 95134

TOS 1.4 will directly support 32M partitions; Supra's formatter probably
was written long before TOS 1.4 was. I have formatted 20 meg partitions with
Supra's formatter (because HDX 3.02 does not like something about my system,
and I strongly thing it's my DMA chip) no problems.

HDX 3.01/2 will let any Atari support reeeal big partitions.

While I'm here, can anyone tell me <again?> what the cutoff point for 512 byte
sectors is using HDX? A friend of mine formatted his Seagate 296N with his ICD
utilities (he has an ICD HA, of course), and used HDXPREP and then HDX to
partition the drive into four 20 meg partitions. His sector size is 1024 bytes.
Someone else said that the sector size stays at 512 bytes 'til you reach the
32M+1 region.

Mike

Where's the beef??

Well, for one there is the still the fact that no NEW ST book has
been published in the USA for 2 years.

And the fact, that even Greg admits, that you can't buy *ANY* ST book
in the major bookstores. Just ask someone in a Waldenbooks store and you
will either get laughed at or they will mutter something about the Atari
just being a "Games Machine"

Greg, are you on a paid retainer by Atari Corp?? I have *NEVER* seen you
take a stand criticizing Atari Corp on *ANY* matter?? If you aren't,
you should ask Atari Corp to pay you !!

But, you are correct, the Mark Williams C manual is a great source of C code
for GEM AES/VDI.

But where do you go for info on programming for GDOS?? GDOS is one big black hole
as far as Atari Corp is concerned. It isn't covered in any C book that I have.
And programmers are all having problems writing GDOS printer drivers.

So, where's the beef?? I would answer "In Sunnyvale!!"

(At least there's lots of beef by-products emitting from Sunnyvale judging
the strength of the odors!).

Opinions are my own, but are for sale. Send MegaBucks.

I'd also like to see some GEM C programming examples. Especially those on floating menus: I'm writing a terminal emulation prg/acc and want to use the whole screen as the terminal screen and have a floating menu pop up when I click the right mouse button. (The left mouse button is reserved for the dialer :-)).

>and CAN't run properly on Mega-St-Color-cards (8-Bit == 256 Colors!!!) or
>on the TT.

I fully agree to that.

But how do i get the number of bytes in a picture-line , without calling linea_init(). ($A000) .
Yes for the three 'normal' ST-ScreenResolutions you
can divide the pixels per line (work_out[0]+1) thrue the number of planes,
(you can get this value with vq_extnd(); taking workout[4] , i guess)
and divide that thrue eight.
But if you try this method with 'Overscan' (also called 'Hyperscreen', 50% more Screen-Resolution for 3DM, in ST-Magazin) or with a 256 Greyscale-card, you will fail. Because there is some memory in each scanline which is not used for display.

My question:
Is there any legal possibility to ask via VDI or AES about the offset in bytes between two picture-lines? Is there another way than LineA, to find the VDI-ESCape variables? Will the TT-VDI have new VDI-Funktions to solve this problem? How do i findout how much memory is needed for the physical Screen.

From: jeh@elmgate.UUCP
Message-ID: <1218@elmgate.UUCP>
Source record: 242922

It's interesting to note that at about the same time that an Atari employee was complaining about STE documentation being posted, an employee of a competing company was posting complete specs on how to design for one of their expansion ports.

There's plenty of information which should rightly be covered by non-disclosure agreements: future products, strategies, etc. But any effort to restrict the spread of the information necessary to use, program, or expand a current product is misguided.

(Of course, as bad as the Atari distribution network in the US is, perhaps the STE isn't a current product yet. But I hardly think that would be an acceptable excuse.)

With non-support such as this, I'm frankly surprised that there's any public domain or shareware software available for the ST. And unless the policy changes, I'd expect free software for the STE and TT to be even more rare.

>Can anybody explain the difference in the result when using an 'int' or
>'long int' as array-index?
>Joep,
>PS: don't tell me this is a feature!

The first thing that comes to mind here is that the compiler is not
converting j to an int before placing i and j on the stack. If this is
the case, and assuming i and j get put on the stack first, the stack would
look like this:

0x2000 (lsw of j)
0x0000 (msw of j)
0x2000 (i)

Then, when it goes to pull two ints off the stack, it gets 0x2000 (which
gets substituted for j) and 0x0000 (which gets substituted for i. Now, we have:

fprintf(stderr,"%lx, %lx\n", &(tab[0x0000]), &(tab[0x2000]) );

Now we have two different addresses that are offset by 0x2000 x sizeof(long)
if sizeof(long) == 8, that would explain the difference you got, but I thought
a long was 4 bytes... But this is how you could get different results by
passing the wrong size object, anyway. If you want to use a long as an
array index, try this:

#define tab(X) (*(tab + sizeof(long)*X))

Then you can do things like:

tab(100000L)=4567L;
printf("ADDR=%lx, VALUE=%ld\n",&tab(10000L),tab(10000L));

---jb
```

P.S. - I highly recommend turning on every warning that the compiler supports, this will usually catch things like using longs as array indeces, and other nasty litte oversights.

There are some gulam parameters that can be set in a startup file.
They are called, I believe: 'set env_style <style>' where
style can be three separate flavors. (Here my memory is faulty about
the types, but I use 'gulam' style).

I don't know quite what this means, I don't recall reading a description
in the docs. Anyone know more about this?

>good GEM books, and thought that it had lots of errors. Although some

Does this mean they've fixed them, then? My *own* problem (since I've moaned a bit about the lack of docs in past as well) is that I bought about half of the Abacus set when they first came out (first editions) and at that time they were riddled with errors. Not the sort of thing to encourage me to go buy another copy, even if it did say 'new edition' on it. On the other hand, if they are *really* better...

My present favorites are the 3-volume Compute! series (one book each on AES, VDI, and TOS) and Katherine Peel's 'The Concise Atari ST 68000 Programmer's Reference Guide' -- but not the first edition which was lacking any form of index.

I have seen a friend of mine do it. He bought the part over the counter at an electronics supply house. I believe Best Electronics has this part (and others for the ST). If anyone has the address for this company, please post it (I was told that they sell a cable kit for hooking a 5.25" drive to the ST).

env_style has nothing to do with this. env_style determines
how the environment variables are setup, and how the
command lines/environment programs are setup before a program is lauched
via Pexec(). the possible value are
'bk' beckemeyer
'gu' gulam
'mw' mark williams
gulam.doc talks about what each of these means.

topgun@chaos.cs.brandeis.edu (Chandra Bajpai) writes:
>What type of sound chip does the STE use? Is it different from the ST?
>Does the quality of the sound chip rival that of the Mac II/NeXT/Amiga?

The STe has two sound subsystems. One is like the ST's: it's a Yamaha PSG (Programmable Sound Generator), also available from General Instruments (I think), which is why you see it referred to as "The PSG" and "The GI Sound Chip."

The other sound subsystem in the STe is our own creation: it's a two-channel 8-bit digital-to-analog converter which is fed by DMA (direct memory access), which means the processor can set it up and then go do something else while it's playing. You will hear that referred to as "digital sound" or "DMA sound." Data goes to the DAC at 50KHz, 25KHz, 12.5KHz, or 6.25KHz, selected in software. There are two channels, one left and one right. You can play monaural sound out BOTH speakers and use only half the data.

The quality is very good. I don't know how to quantify that. Remember that digital sound is only as good as your sampler plus your playback (including amp and speakers), and the STe serves as part of the playback system: you provide the amp and speakers. The sound will come out the monitor's speaker, but that's not stereo and it's just not up to the task.

The NeXT box has a DSP (digital signal processor), which doesn't just play back sound, it GENERATES it from formulas or other data. That's a different beast altogether. Amiga's the same way. I guess those chips can simply play a sampled sound, and I don't know how to compare them against the STe's sound capability. The STe is certainly better than the Mac's digital-sound-output mode: the (highest) sampling rate is higher and we use better filters to smooth out the "jaggies."

For more technical specs you'll have to write to Atari; I don't know anything about audio electronics.

This is all very well and good, but then how does one go about using PD programs that require GDOS? Case in point: I have Opus, and would really like to use the charting functions, but that requires making metafiles. Actually, I have GDOS, as distributed with my Wordup disks, but I still lack the META.SYS file I need for Opus. So do I need to buy a commercial program that includes META.SYS? Or can I buy it separately? Or is it public domain? I've posted this question a couple times before, with no response, so perhaps I'll have better luck this time.

>huh? Dgetpath/gemdos whoever *does* monkey around in the buffer
>you supply.

That's what I said: Dgetpath writes the the current path into the
buffer you supply, and since you can't tell Dgetpath how long that
buffer is, it'd better be long enough. If your current path is shorter
than 32 chars, Dgetpath should certainly not clobber anything outside
your 32-char buffer.

> the developers gemdos documentation states that 125 is the max
>path length. i guess its either obsolete or incorrect.

That has always been specious: I think the original author must've used
that number because it's the longest filename you could pass as an
argument to a program via Pexec. There's no such limit on filename
lengths and never has been.

> dlh@raider.MFEE.TN.US

How exactly are you stealing the "print screen vector"? One possible way
to do this is to install a VBI that runs before the OS VBI and watches
for the print screen flag at $4EE (int). (When the flag is zero, you
do your stuff, then set the flag back to -1 and jump through the old
VBI vector.)

If this is what you're doing, your problems may be caused by the fact
that the Bios, Xbios, and GEMDOS are not reentrant. If the user presses
ALT-Help and your VBI routine interrupts the "foreground" process (i.e.,
the program currently running) while a Bios, Xbios, or GEMDOS call is in
progress, things will be royally screwed up when you do any OS traps in
your code.

One way to prevent this is to look at the information placed on
the stack when the VBI interrupt occurred. Check the PC on the stack
against the global system variables membot and memtop ($432 and $436 resp.)
to be sure that you're only interrupting non-OS code.

My experiments with this sort of thing have led me to believe that this
is NOT very reliable. In particular, with TOS 1.2 I occasionally got
strange behavior from the GEMDOS where I would get "Sorry your disk
is write protected" alert boxes until I rebooted. With rainbow TOS
this doesn't happen. Hmmm...

The env_style controls the format of environment variables in memory. The
"gulam" or "mw" style is the format used by the Mark Williams C runtime support.
In this format, an extended command line is passed to called programs by
sticking a variable "ARGV=" in the environment, etc.

I've never used any of the other style(s?) and don't know what they represent...

The most objective and reliable source I have been able to find for information regarding the STe and TT are Current Notes and STart magazine.

The February 1990 issue of STart has an excellent in-depth look at the TT and its new operating system. STart has had the most BS-less, objective and accurate info in its last 3 or 4 issues on the STe and TT. Most of what I've seen on this newsgroup about the TT and STe has bordered on rumormongering (not to put any of you down, it's just hard to keep track of all the gossip we spread).

Current Notes magazine has had timely, official information on the TT and STe since their introduction at COMDEX. It seems as if CN's shorter publication lead time helps the recency of what they publish.

(By the way, I tried mailing directly to you, James, but our VAX didn't like the address)

Apple also has a level of support for the "casual" programmer for something like $60 for Mac hobbiests. I believe that buys telephone support and a newsletter.

Thanks for the tip. I wasn't aware of the different screen sizes. I wrote the scroll code over a couple of hours after getting the left and right border overscan working (finally!). I put in the top border bit to get over the loss of screen. I always assumed STs were all the same. All I know is that my code works on my ST so I'm happy :-) But no matter, I'm sure any hackers who've seen my code and understand the principles can sort out the technicalities.

2243. Q:Magic Shadow Archiver A:space ace Q:BattleTech

Newsgroup: comp.sys.atari.st
Date: 1990-03-02 02:58:00 UTC
From: WSCART01@ULKYVX.BITNET
Message-ID: <9003020451.AA12476@jade.berkeley.edu>
Source record: 242937

Has anyone ever heard of Magic Shadow Achiver? It is a program copyrighted in 1987 that takes a disk and converts it into a file format so that it can be transmitted over the phone. I need to get the PD release text that placed it in the public domain. (At least I hope it is in the public domain since I have it and didn't pay for it. ;-) With this release we can get some nice demo programs uploaded to the binaries.atari.st archives. RSVP Mail!

On another line of thought:

I remember someone asking about Space Ace and if it was out yet. Nope, I checked with my dealer (Computer Gardens, i highly recomend them!) and he said it was not going to be out in the near future. He said maybe in a month! (GADS!) I did happen to come across a 18 second demo of Space Ace and have made it advalible (Mail me a request within the next week or two and i'll mail it to you) but it is about 400k and my De-archiver takes a 1 meg machine to de-STU it. I must say it is NEAT!

A request:
Does anyone have infomation on 'BattleTech'. How does it relate to the board game? Do you recomend it?

[about the abacus gem books]
>
>Does this mean they've fixed them, then?

Well, my experience with the Abacus GEM book (which is better than
their others, I think) is that the errors in the 1st edition fall in 3
areas:

1) obvious typoes, easy to correct, some only after a little
experimentation :-(
2) errors which are copies of errors in DRI's documentation (which
Atari sells in its devkit)
3) failing to explain which calls are only useful when GDOS is
around. I've seen several people asking questions here who
obviously tried to read the manual and were very confused on this
score.

As such, I've had reasonable success using it for some small GEM
stuff, although I never tried anything with GDOS.

I haven't read the 3rd edition, but I believe a review was once posted
here? I also don't know if any of the GEM books have useful tricks
like the little routine that intercepts right-button events and turns
them into left-button events. I'd also love to see someone do a SANE
binding for GEM calls that passes pointers to structures instead of a
bunch of variables that everyone keeps in structs anyway. I managed to
cut the size of the GEM demo program source in half that way, and the
object code for the demo itself (sans bindings) shrank 35% or so. Less
bloody stack-pushing and popping for stuff that's going to get popped
and shoved into arrays anyway.

I bought my 520 STE in december-89 and I'm very satisfied with it, except for one thing. If I try to access a disk and it isn't inserted I get the (CANCEL) (RETRY) dialog box. If I put in the disk and click on (RETRY) the machine BOMBS!!!!! (with bombs on half the screen). The same thing occurs if I try to write to a write protected disk, remove the write protection, and then click on RETRY.

Has anybody else experienced this??

>I don't want to make this decision in a vacuum. What do you all think?

Well the Timer C interrupt seems to be quite an important issue when trying to
achieve stable colour screen interrupts. Degas Elite subverts Timer C
completely during screen interrupts and Neochrome lowers the IPL level.
My own technique follows the Neochrome example and I believe is less traumatic
to the system but would welcome Atari's own thoughts on it.
None of our handlers change the timers characteristics though so I guess I'm
voting with Allan on this.

2249. READING HD HYSICAL SECTORS

Newsgroup: comp.sys.atari.st
Date: 1990-03-02 10:39:47 UTC
From: cs325ec@ux1.cso.uiuc.edu
Message-ID: <16000016@ux1.cso.uiuc.edu>
Source record: 242943

Someone from the Netherlands responded to my post about
reading physical sectors from a Hard Disk. His code was
accurate and worked... Setting bit 3 in the rwflag enabled
physical sectors to be read... but... Secno however,
is an int and can not be higher than 32767 or 65535 if
Rwabs can handle unsigned, so how do I read sectors
higher than those?

Thanks in advance.

-Greg

#>->> > main()
#>->> > {
#>->> > printf("1: %d\n", MAX);
#>->> > printf("2: %d\n", (int)MAX);
#>->> > }
#>->>
#>->> This is not a bug, its a feature. MAX is not a number, its an expression.
#>->> Thus, the evaluation of MAX is a long int. The first printf only prints
#>->K&R specify that constants are int's. Not a long int.
#
#Like I said "MAX is not a number, its an expression." There is an integer
#in the expression (the number 32768). But there is also an operator (the
#unary minus). This makes MAX an expression, not a number. Thus the real
#question is what does K&R say integer expression are evaluated to? I
#don't have K&R handy, but I believe it says long ints.
#
K&R, second edition, section A8.2 type specifiers offers these useful quotes:
1. If the type specifier is mission from a declaration, it is taken to be an int
2. The signed specifier is useful for forcing char objects to carry a sign; it
is permissible but redundant with other integral types.
3. At most one of the words long or short may be specified together with int;
the meaning is the same if int is not mentioned.

IMHO, MAX is a constant expression. Since its type is unspecified, it is an
int. Since it is not specified as unsigned, and is an integral type, it is
therefore a signed type. Together the conclusion that MAX is a
"const signed int MAX" when all the defaults are considered. K&R say nothing
about the issue of long or short. Neither does section A7.4.5 on the unary
minus operator. The issue of long or short is probably best resolved in the
traditional manner i.e. an integer is the size of the native machine word.
This is 32 bits on a 68K. A 8086 or 286 would be 16 bits by the same
tradition. The native int on the 68K is then a long int, and on the Intel
it is a short int. The expectation that short int means 16 bits and long
int means 32 bits is still meaningful. The answer to the question is
machine architecture dependent. For purposes of the discussion at hand, the
68K compiler should treat MAX as a signed 32 bit integer.

2254. Re: Cheapest way to hook a SyQuest to a 1040ST?

Newsgroup: comp.sys.atari.st
Date: 1990-03-02 14:18:44 UTC
From: Xorg@cup.portal.com
Message-ID: <27462@cup.portal.com>
Source record: 242948

My new Syquest drive should show up today so I'll be able to answer all
your questions. I paid $899 for the unit, considering that it comes with
a case, the great ICD Host Adaptor, and all the necessary cables, etc.
for the addition $200 over the cost of the mech alone, I think its well
worth it (the Host Adaptor alone runs $125) Reports from the field indicate
that the Syquest works fine with Mac and MS-DOS partitions, and thats why
I bought the unit, one platter for each OS. The three companies currently
marketing the removable for the ST is Toad of Maryland, Carter of Ohio, and
ABCO in Florida - Atari's units is due soon, but again, too late and for
to much money...
Pete

2255. Re: Mac emulators and Hard disks

From: Xorg@cup.portal.com
Message-ID: <27463@cup.portal.com>
Source record: 242949

Mac emulation - Spectre GCR is the *only* way to go. No messing with
funny disk formats, Mac disks work out of the box and
run at speeds faster than a real Mac Plus. Aladin is
pale by comparison.

Hard Drive - If you want a great price and future expandability I
suggest an ICD FaST 50meg drive with the Seagate 157N
28ms drive inside - this baby can be had for around $650
and comes complete - and upgrading is as easy as tossing
in a new mech and buying a double crimped cable - the
software is also outstanding.

Remember that Turbo-C passes function arguments in registers. Since gulam is
not written in Turbo-C it expects the parameter to the callgulam()-function on
the stack. If you compile your program with the option to pass parameters
on the stack, it should run. You can also declare the variable cgp as

```
cdecl int (*cgp)(const char *); /* pointer to callgulam() */
```

2257. Need Help with 5.25 floppy

Newsgroup: comp.sys.atari.st
Date: 1990-03-02 16:16:01 UTC
From: jensen@cod.NOSC.MIL
Message-ID: <1808@cod.NOSC.MIL>
Source record: 242851

I have finished (?) installing a 5.25-in floppy drive on my 1040ST, but have run into what to my untrained eye appears to be a catch-22 situation on boot-up. I haven't seen this discussed before, so I think there must be a simple explanation/fix. Just for the record, this is an Epson drive.

If the floppy head isn't near track 0 at boot time, there is a vibrating sound from the drive, and it appears that the drive is trying to seek to track 0, but not succeeding, presumably because at that point the step rate hasn't yet been slowed down to 6 msec. Therefore the drive doesn't find track 0, the computer doesn't see the TRACK 0 signal asserted, and the computer comes to the conclusion that there is no drive B.

Even though the program to set the seek rate is now executed from the AUTO directory, it doesn't matter, as the computer has given up. So I can't run a program that parks the heads on drive B. And on re-booting the whole problem repeats itself.

What do you do about this situation? At this point my drive is in the open, so I manually reset the head before powering up the drive, but once it is in its case that won't be an option. Is there a program available to park the head before turning off the drive? (I know I'll forget to run it half the time.) How about a program to tell the computer that there really *is* a drive B after all, stuffing some information into a magic memory location? I don't have any documentation that would tell me about such locations.

Do other types of drives manage to find track 0 even without the step rate change?

Any help this would be appreciated.

Yep, Michtron now sells a fax machine for the ST. I think that there is an
ad in the March issue of STart, here in the USA. It accepts files from your
ST and send them. It receives faxes and saves them as files on your ST.

Ask Michtron for more info.

2259. GDOS, BITIMAGES & .IMG

Newsgroup: comp.sys.atari.st
Date: 1990-03-02 16:54:54 UTC
From: n-waters@NIMR.MRC.AC.UK
Message-ID: <9003021654.AA11643@nimsn41.>
Source record: 242853

Hi there all,
A short while ago I was asking about printing with GDOS, thanks to all
who replied. I can now print text and vdi graphic commands, but I am confused
about printing bit images. By the way I'm using GFA Basic 3. The only way I
haveachieved anything is to load the pic a byte at a time and plot its colour.
I am working in monochrome. This results in a postage stamp print out of my
pic.
I then proceeded to think about scaling the pic and ended up in total
confusion. Hence anymore help would be gratfully appreciated.

My second query is about IMG files. I know they contain a header which has the
x,y info etc. However, how do you set memory up so that pixel values off the
screen do not wrap round to the next line ie how do you increase the page
width in memory.

Many thanks,

Nick.

The latest version of this program is 1.3, which I have. I believe it is
shareware (I have not yet really looked at it). I can check when I get home.
It would be nice for comp.binaries.atari.st, as it saves formatting info about
the disk it is crunching. Fairly good compacting algorithm too (from what I
hear).

Well, the DSP in a NeXT can do some pretty amazing things, but it's a silly use for that hardware. I like setting up sound routines in the background and then going my merry way hacking/etc. on the ST. On the NeXT, you don't get any sound of any kind when the DSP is used for any computational purposes. That is, unlike a disk drive, there's no way to share access to the DSP between multiple tasks. Also, for most of the stuff I've played with, the sound is cut-off whenever other tasks are driving up CPU and disk use. This makes no sense to me, since the DSP should be executing its program independently of the 68030. But the end result is that sound on the NeXT gets chopped up horribly if you try to do anything else along with it. (Like open a new window.)

Cute, isn't it? Steve Jobs turned a wonderful processor (68000) into a toaster (Thin Mac). Now he's turned Unix on a 68030 into a single-user single-tasking non-operating system. Will wonders never cease. I wish they would...

>
>Joep,
>
>PS: don't tell me this is a feature!

Ok, I'm not going to tell you this is a feature but it isn't neither
a bug. The keypoint is, that in order to access an element of a vector
larger than 32K (this is true for tab) you m u s t always use
a long index. For the program above Turbo-C generates something like this:
...
lea tab,a2 ; a2 contains vector base address
move.w #$2000,d3 ; i=0x2000;
move.l #$2000,d4 ; j=0x2000L;
move.l a2,a0
move.l d4,d0
```

```
lsl.l #2,d0 ; muliply d0 by 4 == sizeof(long)
add.l d0,a0 ; a0=&tab[j]
move.l a0,-(sp) ; push a0 for printf
move.l a2,a0
move.w d3,d0
lsl.w #2,d0 ; some as above, but now: bits 14 and 15 are lost
; this means d0.w will be 0 now.
add.w a0,d0 ; a0=&tab[0] !!!!!
move.l a0,-(sp) ; push a0 for printf
...
So, the calculation of &tab[i] failed because 0x2000*4 > 32K and this is
too large for an int.
BTW, the information to use long indices in conjunction with large vectors
is already included in the README-file that comes along with the compiler.

2264. Mac Emulator, what to buy?

Newsgroup: comp.sys.atari.st
Date: 1990-03-02 18:54:33 UTC
From: nickw@syma.sussex.ac.uk
Message-ID: <2309@syma.sussex.ac.uk>
Source record: 242858

We have a 1040 ST here in the lab at Sussex, and will shortly have a few more. We are interested in buying a Mac emulator, and we gather that those which use Mac roms are better than "pure" software emulations.

1) Is this correct?

2) Where do we buy said emulators (UK or USA preferred)?. (Names of the product etc. also needed).

Email please, as I'm sure this is an FAQ and I can't read the ST group regularly (too big).

Nick

> Rwabs can handle unsigned, so how do I read sectors
> higher than those?

With the old hard disk driver, you can't. With the new one, you can: I believe you use a secno of -1 as a signal, and add an extra argument at the end: the LONG sector number you want. I could be wrong. By "new" and "old" I mean 3.x is "new" and 2.x, 1.x or no version number at all is "old." Get the developer's documentation for the AHDI 3.00 Release Notes: it has the straight scoop on this and much more.

I hope you are not assuming that a logical sector is 512 bytes; that's no longer always the case, and people will not be able to use your tool if you make that assumption. Physical sectors, though, *are* always 512 bytes (as far as I know), which adds a level of complication when you do physical-sector reads and writes. In other words, get the docs on this or you will probably get it wrong.

>"const signed int MAX" when all the defaults are considered.
> [...yet more deleted...]

The ANSI C draft, section 3.1.3.2 "Integer constants," says that type of an unsuffixed integer constant (i.e., no "L" or "U" suffix) is the first type from the following list big enough to hold the constant: int, long int, unsigned long int. I don't know how Turbo implements int on a 68k; the "natural" word size of a 68k is somewhat ambiguous, since the processor handles 16- and 32-bit computations equally well. If Turbo uses 16-bit int's, 32768 is promoted to long because it does not fit in an int; the "-" operator is then applied to the long, which results in a long. If Turbo uses 32-bit int's, 32768 fits in an int and no promotion takes place; applying the "-" operator does not result in any promotion, either, since, when it is applied to an int, and int results (see the draft, section 3.2 and 3.3).

The real answer is you dont. And this is why.
The use of bit 3 is/was really to get to sector 0 and maybe 1 and 2.
(1 and 2 might contain a list of bad blocks). After this, very limited
area, it is expected that partitions will cover the physical disk.

TOS partitions can then be accessed by drive and offset.

What about Spectre and Minix partitions? Then you need your OWN driver
that will access sectors as a long absolute value. Thats what Spectre
and Minix do.

2268. Sozobon C HCC 1.2 problem

Newsgroup: comp.sys.atari.st
Date: 1990-03-02 19:59:34 UTC
From: S61304@PRIME-A.POLY-SOUTH-WEST.AC.UK
Message-ID: <9003050807.AA15943@ucbvax.Berkeley.EDU>
Source record: 242862

(From "The Masked Rat Fink" "Computing and Informatics Yr4")

Does anyone know if there is a problem with the binary of HCC in the Sozobon 1.2 upgrade?

I'm using it from within Gulam and am getting three bombs, it then returns to the shell and allows me to continue. It creates an empty .S file /w len=0.

My setup is a 520STFM /w 1Meg, DCSHOWIT in auto and the QMI DeskCart! booted, using Gulam (beta test version, is there a newer one kicking around??).

I would appreciate any thoughts on this situation.

Also, if I call CC whilst in the root directory, using the PATH environment variable in Gulam, CC then comes back and says that it can't find hcc!! This is perplexing, because hcc is in the same directory and is callable from the shell.

Again, thoughts on this problem welcome.

2269. 68000 assembly code

Newsgroup: comp.sys.atari.st
Date: 1990-03-02 20:31:34 UTC
From: gray@hplb.hpl.hp.com
Message-ID: <GRAY.90Mar2153134@ghiggins.hpl.hp.com>
Source record: 242863

DEC recently announced the availability of Scheme->C, a Scheme to C translator. I downloaded a copy of the code and would like to try and get it running on the ST. There's a snag, however (isn't there always?) --- there is a .s file which deals with saving and restoring registers, counters, etc. (to facilitate call-with-current-continuation) and some integer arithmetic overflow handling. The code is in VAX assembler and needs translating to 68000 assembler. It *looks* like a fairly straightforward translation, but I could use some help in ensuring that I get it right --- any offers?

Anyone try out Gemini yet? I run Gemini.prg after booting
with either AMCGDOS or GPLUS and get two bombs...???

Anyone got it to work want to comment? I tried removing
every auto prg and acc save amcgdos and shell0... No luck.

Went through the configs... set it for drive C: still
no luck.

Damn, I really wanted it to work... Is it any good in
a 1040 anyway? (Memory usage?)

Thanks for any tips

>Has anybody else experienced this??

I have seen things like this, but don't remember where. I have used
a 1040 ST and now use Mega ST2. I just tried an experiment...

remove floppy from drive A:.
drag icon for a file from drive A: to drive D:.
get the CANCEL-REPLY dialog box.
put the disk back in.
copy proceeds just fine.

Does this sequence this give you bombs too?
It seems to me that the times I have had trouble have been while
running application programs and I have had both bombs and program aborts.
I try to keep my drive a: loaded most of the time.

"You must leave Timer C in the MFP as it was originally programmed"

Sounds good to me. The TOS is already such a mess trying to be compatible with a whole market of hacked, sloppy programs that we all know the idea of a multi-tasking GEM is almost hopeless. I'd support much more drastic rules and changes for the ST. That way, developers can start easing their programs towards compatibility now, so that if the great multi-tasking TOS 2.0 ever appears, every program will not suddenly die.

Cache sizes that small won't do anything. Expect to give up at least 200K for an 80 meg hard drive. I'm unfamiliar with how the numbering works using ICD's latest and greatest, so you'll have to interpret 200K to whatever those categories mean (they seem redundant to me).

Also, your Newsgroups: line is set to your Email address; please try 'n fix that, as it can make replying a pain.

Not that I can claim that I know what I am talking about...but...
From a early article in Byte on the NeXT I seem to remeber the memory
that the DSP has is quite limited. I would guess that the 68030 has
to swap in new data all the time.

Isn't the *only* reason it was installed was for 'CD' quality sound... wasn't
the 030 supposed to handle the tasks?

Working on release 0.9, I am amazed every time I log onto it... just wait
until it gets to 1.4...(isn't that the magic number??)

Another thought: How many songs do you want to hear concurently?

PS: see you on comp.sys.next

Since I don't think Mr Jobs will be able to reply I felt someone should
offer a little reality.

> menu bar was gone. Then I remembered: I have to save the menu bar, but how?

A long time ago, Moshe Braner posted a skeleton program for converting a
TOS application to a desk accessory. In it, he saved the menu bar manually
by copying the first 1520 bytes of the physical screen to a safe place, then
copying it back when the ill-behaved desk accessory was ready to go back
to sleep. You find the physical screen by calling Physbase().

The DA also calls form_dial with the desktop's dimensions to cause the
screen manager to send redraw messages to any affected programs.

I've tried it and it works fine on my system. I believe it's the technique
he uses in the DA version of GNOME (GNOME's Not Ordinary Micro EMACS).

The 1520-byte figure is fine for low, medium and high resolution, but it's
not going to work on a Moniterm or Image Systems display. Anybody want to
take a crack at a function that returns the proper size for the cheater's
menubar buffer, based on GEM's notion of the screen size?

2278. Problems with Files using HD Backups and GEMINI

Newsgroup: comp.sys.atari.st
Date: 1990-03-03 19:59:54 UTC
From: bmaraldo@watserv1.waterloo.edu
Message-ID: <1322@watserv1.waterloo.edu>
Source record: 242872

I really need some help with a problem I am having. First, I'll
describe my system: original 520St with a 2.5M upgrade, TOS 1.4 in EPROM,
20M Supra, mono monitor and double sided 3.5" drive. The problem: when I
use a hard disk backup program the files wirtten to floppy are randomly
corrupted, that is some of the files get corrupted some don't, its about
50/50. Most of the text files are fine but the .PRG .TOS and .TTP programs
get munged. This happens with Oscar and dliII or what ever that *GREAT*
back-up program recently posted was called.
Now, when I run GEMINI I get the same probelm when I transfer
files around ont he HD (painful when using TeX because I have to go and
find all the nasty characters in the corrupted file), and when I transfer
files from the HD to floppy (the floppy files get corrupted). *This problem
doesn't happen when I use the standard desktop!* I have to back-up my HD
manually which is a pain and I can't use GGemini which is a *GREAT*
desktop! In my \AUTO I have MACCEL the mouse accelerator, AMCDOS (the GEMINI
gdos substitute), POOLFIX, and FOLDER250. My .ACC are: KRoget, Mdisk,
QuickST, and ZTime.
If somebody can tell me what is happening I'd appreciate it. I'd
also like to solve the problem. Oh, one other important thing: the problem
still exists regardless of whether the 2M memory expander is connected and/or
the .ACC and \AUTO progroams are installed; ann empty virgin 520ST with TOS1.4
still causes the problem (with HD backup programs- I have't tried this with
GEMINI). Please help.

>

I also got a bus error (2 bombs) on running Gemini. I ran it with the MonST 68000 debugger and found out it was accessing priviledged memory. I set it to supervisor mode and let it continue. It then announced that it doesn't work with TOS releases below 1.2 :-(

I've had my STFM quite a while and, depending on what program I ask, I either have 1.08 or 1.00 (I think it's the former).

Oh well... better go out and buy Rainbow TOS :-) (I wish I could afford it!)

Dave.

Well, I was looking foward to using it too. I de-zoo'ed it, and started
picking throught the DOC files, which are in German, of course. Well, the
first paragraph answered the problem I had. It requires TOS 1.2, 1.4, or
1.6. So if you have 1.0, thats probably your problem, like mine.

I have both the Omnimon Rainbow and Omnimon GS (grayscale) monitors and both have very good hi-res definition for use with GCR or the ST in mono mode. In colour mode on the Rainbow the colours are crisp and definition is sharp. I recommend these highly (and have no affiliation with WUZTEK who distributes them).

WUZTEK is at 714-544-7888 (fax=714-838-5531) Tustin California)

Does anyone have experience with FAST-FAX from Michtron?

FREE????? I think not Mr. Covert. Why do you think that Apple computers with similar options to Atari computers cost about twice as much? One reason is because Apple is committed to providing information about those computers. Of course they have to pay someone to do that, so they just charge more up front to cover the cost later. The information you're getting is not free, but only appears to be free. Why do you own Atari equipment? Probably because you were able to pay less for it up front. Now you are finding out what you gave up. For a lot of people this alternative makes sense. I know it does for me. If you would consistently use a calm, gentle tone when asking questions, instead of the impatient, whinning tone that you have demonstrated time and time again, you would probably get more answers. For free, even...

Well, thanx to Samuel Streeper and Greg Lindahl for providing me with the info on how to save the menu bar. I tried it and it works!

I have another question about our almighty GEM.

How exactly does GEM know when you intend to close a desk accessory? That is, how does GEM know when to send the message AC_CLOSE to evnt_multi? The few books I have on GEM do not go into much detail and I am confused.

Again, I'd appreciate any help I can get! :-)

GEMINI crashed on me the first time I tried to run it (two bombs). After
running shell0 it worked fine. Since then it has worked whether I run shell0
or not. Would someone explain just what shell0 does?

Overall, GEMINI has just about everything I've been wishing for in a graphic
shell. Kudos by the ton. I have encountered three problems that are slightly
irritating.

1. If the mouse cursor is on the menu bar when exiting from the
shell the mouse starts leaving crud all over the place
2. I think I don't have it configured quite right, since I get a "this
application could not find file" when I quit back to the (standard, boring)
desktop.
3. Timeworks DTP quit back to GEMINI suddenly after printing a file.
GEMINI then quit back to the desktop, which locked up. This has only happened
once, and I haven't had time to try to duplicate it. (I've only had GEMINI for
about, what is it? 23 hours now.) I hope this is not caused by AMCDOS. Not
only does it speed up GDOS text, but bitmap drawing is _much_ faster and
smoother.

These aren't really GEMINI problems

4. Whenever I try to load GEMINI or UNITERM fonts into the FONTZ!
program they always end up chopped horizontally, with offset character
boundaries. What is causing this? Is there a better font editor that doesn't
do this?

5. Is it possible to create your own custom icons for GEMINI? This is
probably in the dox, but I don't know German.

Thanx

I have seen an Omnimon setup (comes with monitor and interface bundled), and
it is very impressive. The colors for the color display look much better,
the mono display looks just slighly grainy (from the color mask). It is
certainly usable, just not quite as super-crisp as an Atari mono. I am
seriously considering getting a multisync, with the hopes of getting a real
mono in the future (the color display is that much better, completely blows
away the Atari color monitors that I have seen). That way, if one monitor
dies, I do not have to suffer a work loss (although no Populous would really
suck).

I am getting ready to do this myself. All indications point to Prospero C
as the best choice in my book (ANSI standard, real support, good docs, complete
language family to work with). I suggest both to myself and you, however, to
try the two PD C compilers, Sorbon and GNU. I have seen much net buzz on them,
but I do not know if they are complete (ie GEM library, ability to use from
GEM instead of a command line interpreter, etc). When I say complete, I mean
the ability to create stand alone GEM, TOS, and TTP applications easily.

I think the real dope on that is that one cannot copy the Mac roms onto a
disk without risking an immediate (they have shown the willingness) lawsuit.

>2) Where do we buy said emulators (UK or USA preferred)?. (Names of the
>product etc. also needed).
>

Dave Small's GCR is probably the way to go, since it is the only one I know
of that reads Mac disks directly. For that matter, I think Aladin has gone
out of business, which only leaves the Magic Sac (old Dave Small hack),
Spectre 128 (much better Dave Small hack, everything the GCR is without the
disk compatabiliy), and the GCR. Also, Magic Sac is no longer supported
by Dave (a company change).

2290. More on the Gemini desktop

Newsgroup: comp.sys.atari.st
Date: 1990-03-04 05:20:35 UTC
From: icsu8053@caesar.cs.montana.edu
Message-ID: <3458@caesar.cs.montana.edu>
Source record: 242884

After reading the info I included with the Gemini posting, I realized I forgot to mention a couple of things:

- Gemini does NOT run with versions of TOS previous to 1.2. I'm starting to take 1.4 for granted, seems Stefan Eissing (the author) took it for granted as well in his posting. Gemini is another good reason to get TOS 1.4, believe me.

- I accidently included *my* desktop configuration in the distribution. It is not very exciting and does not illustrate everything that can be done on the desktop. If there is a demand, I will try and dig up the original gemini.inf file. Sorry 'bout that!

- I forgot to mention that Gemini seems to support a limited naming of volumes. For instance, if you name a certain disk and drag it onto the desktop then remove the disk from the drive, the next time you attempt to open that disk, it will tell you to insert volume whatever into to the drive. This may work for files as well. I'm not sure on exactly how to do it right now 'cause I'm not at home. Experiment. At worst, you might only reformat your hard disk. (only a joke |^))

Boy, if I'm not careful, I may learn everything about this program before I get the English documentation; I doubt it though. Please post or email ANYTHING you learn about this program! I am willing to help answer questions about Gemini and I'm sure there are a few. I don't know the memory require-ments of Gemini but it *should* run in 512K. The key is having the right version of TOS. Hope this helps somewhat!

Apple advertises a great deal more than Atari. I saw one report that 40% of Apple's income goes to advertising. Not a trivial amount.

Jeff

2292. Yet another memory upgrade 520ST -- 2.5 Meg

Newsgroup: comp.sys.atari.st
Date: 1990-03-04 06:23:29 UTC
From: logajan@ns.network.com
Message-ID: <1990Mar4.062329.5408@ns.network.com>
Source record: 242886

Yet another memory upgrade procedure (old style 520 ST to 2.5 meg)

I was running out of room with my EZRAM 1 meg upgrade, and it was starting to act flaky (it would wiggle loose from the MMU socket.)

So I sent away for some 1Mbit DRAMS from Microprocessors Unlimited Inc.; 24000 S. Peoria Ave; Beggs Oklahoma 74421 (918) 267-4961 for $8.75 each (February 24, 1990 prices.) They sent me 16 Samsung KM41C1000AP-8 DRAMS. Total price $140.00 plus $7.40 for Federal Express delivery = $147.40 -- the fastest delivery of any mail order parts I've ever sent for and received! (Of course, I gave them a credit card number.)

I removed the old EZRAM upgrade -- no need for it anymore.

Then I bent up pins 1,2,3,4,5,15,16,17,18 of each new DRAM so that they pointed out sideways and clipped off all but about 1/16 inch of the pins.

Next I soldered short wires on each of the on-board old DRAM pins 2 and 16. The old DRAM pin 2 wire would later be connected to the bent up pins on the new DRAM, pins 1 and 17 (data I/O) while the wire to old pin 16 would be connected to new pin 18 (ground.) I did these wires first because they would be hard to get at after you piggy back the new DRAMS on top of the old DRAMS.

Now I piggybacked all the new DRAMS on top of the old 520 ST DRAMS. The new DRAMS have an extra set of pins, so you line them up such that pin 9 of the new DRAM is on top of pin 8 of the old DRAM -- as shown below.

```
[=== 1] [18===]
[=== 2] ( 1) (16) [17===]
[=== 3] ( 2) (15) [16===]
[=== 4] ( 3) (14) [15===]
[=== 5] ( 4) (13)-[14] Piggybacked view.
[ 6]-( 5) (12)-[13]
[ 7]-( 6) (11)-[12]
[ 8]-( 7) (10)-[11]
[ 9]-( 8) ( 9)-[10]
```

As you can see 6,5 7,6 8,7 9,8 10,9 11,10 12,11 13,12 and 14,13 pins are soldered together.

```
[=== 1] Din GND [18===]
[=== 2] WRT Dout [17===]
[=== 3] RAS CAS [16===]
```

[=== 4] N.C. A9 [15===]
[=== 5] A8 A6 [14] 1Mbit DRAM Pinout
[6] A0 A3 [13]
[7] A2 A4 [12]
[8] A1 A5 [11]
[9] PWR A7 [10]

(1) A8 GND (16)
(2) Din CAS (15)
(3) WRT Dout (14)
(4) RAS A6 (13) 256K DRAM Pinout
(5) A0 A3 (12)
(6) A2 A4 (11)
(7) A1 A5 (10)
(8) PWR A7 (9)

Now for the tedious wiring job.

Connect each of the wires on old DRAM pin 2 to new DRAM pins 1 and 17.

Connect each of the wires on old DRAM pin 16 to new DRAM pin 18.

From any old-DRAM pin 3, daisy chain a wire to each new DRAM pin 2.

From any old-DRAM pin 1, daisy chain a wire to each new DRAM pin 5.

Now find the MMU socket. Pin numbering (top view) goes like this:

9 8 7 6 5 4 3 2 1 68 67 66 65 64 63 62 61
10 / < > M 60
11 A 59
12 D 58
13 9 57
14 56
15 55
16 MMU CHIP 54
17 (top view) 53
18 RAS1 C025912-38 52
19 U15? 51
20 50
21 CAS1L 49
22 CAS1H 48
23 47
24 46
25 45
26 44
27 28 29 30 31 32 33 34 35 36 37 38 39 40 41 42 43

You need to connect pin 18 of the MMU to each of the new DRAM pins 3.

You need to connect pin 64 of the MMU to a 33 ohm resistor.
Connect the other side of the resistor to each of the new DRAM
pins 15.

You need to connect pin 21 of the MMU to ONLY eight of the new DRAM pins 16 (the low order byte, chips U16, U17, U18, U24, U25, U28, U29, U30 -- on the old style 520 ST.)

You need to connect pin 22 of the MMU to the OTHER eight new DRAM pins 16 (the high order byte, chips U32, U33, U34, U38, U42, U43, U44, U45 -- on the old style 520 ST.)

That should do it. TOS 1.4 figures out the size of the RAM space available and automagically configures the MMU to supply the correct RAS and CAS signals etc for 2.5 meg that you now have.

RE: Cheap way to hook SyQuest to 1040ST

I am using SyQuest HD now with my TUBO16/MEGA4 but the haed disk I have is not TOAD File but an ATARI MEGAFILE 44. Yes It is available in Singapore and not that expensive too. Comparing to the bare SyQuest 44 drive which selling at S$1450 with 1 cartridge I bought my Megafile 44 and 1 44 Cartridge for S$1800 (US$1.00 = to S$1.85). It comes with extra LCD, Power supply plug and 50 pin-SCSI as well as bracket for installing another 3.5" hard disk inside the case. I will put my CONNER 100MB drive (I paid S$1200 for this one)into it. Drive is very well made (I open up the drive to have a close look at the heads and voice coil which make funny noise during startup but not as loud as the Seagate 277R -1 in my Megafile 60. It look durable enough and the head is park into a plas-tic prong to prevent any movement during transporting the drive. The top cover of the drive is fixed with only 2 small screws. ICD HDRATEd is 28ms similar to MEGAFILE 60. Drive is much cooler than Seagate therefore I deciced to put 15OHM 3W resistor to lower the fan speed/noise down. Unhook it from Atari SCSI>DMA card and connect it direct to my Mac Plus with home made cable(per instruction in Spectre GCR Manual) then format a cartridge with CMS HD utility version 5.3 or 5.5.3 The cartridge will be recognized by Spectre and even boot up with the System/Finder written with Mac Plus. Macintosh will not read the cartridge if it is formatted under Spectre. With PC-Ditto (Disk version) I can not boot the PC-DOS from partition C:. PC-DITTO normally doesnot boot DOS if the HD is set to AUTOBOOT with ICD HD Util or Atari AHDI. Although I could get my MegaFile 60 to boot PC-DOS from C: partition with Supra HD Autoboot, Supra Autoboot does not help in the case of Syquest 44 Drive. I will experiment further with MS-DOS 4.01 when I receive my SuperCharger from Beta System Computers AG. hopefully by next week. (Beta System supply MS-DOS 4.01 with their Supercharger and insisted that I should use it to get the full performance). I am now using PC-DOS 3.2 as I found it to be more stable under PC-DITTO than PC-DOS 3.3 or MS-DOS 3.30B.

I will report my finding to the net in due course. BTW SyQuest 44 MB Cartridge is selling at S$190 here. S. Sujarittanonta, School of Architecture,
National University of Singapore.

Frank@umiami asks:
> Where can I get G-Dos? I have never seen it anywhere.
>
> Simple question, someone MUST know the answer.

You can spend big bucks licensing GDOS from Atari, you can buy something like Degas Elite that comes with some version or other of GDOS (there have been several), or you can forget GDOS altogether and buy G+Plus from Codehead Software...

Atari Corp spend years and years fumbling around trying to get GDOS to work right, and never did manage to fix it. Charles F. Johnson and John Eidsvoog (who ARE Codehead) spent a few WEEKS reverse-engineering GDOS, figuring out how it worked, and more importantly, how it was SUPPOSED to work. They then wrote a replacement for GDOS which not only worked the way GDOS was supposed to work, but ran FASTER to boot.

The documentation for G+Plus even comes with a nice tutorial about the way GDOS works... FAR more than you'd normally get from Atari Corp.

Once again, forget about the Atari product, and get the third-party product..

From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <27538@cup.portal.com>
Source record: 242890

Regarding the "Vault and Key" hard drive backup system..

I just used the Vault to back up my 20Meg hard drive, and later restore it..

No problems at all... I particularly liked the fact that it ran well with only 512K, and that it does "incremental" backups between Full backups.

The only problem with the "Key" was that I had to remember to specify the main folder that all the other files and folders were in on the backup disks, or I'd get one large folder called "FEBC" (Feburary backup of C:) on the hard drive... not a problem with the "Key" program really, just my having to remember how to run it...

Jim Sisul writes, about the STart coverage of the TT:

>The February 1990 issue of STart has an excellent in-depth look at the TT an
>its new operating system. STart has had the most BS-less, objective and
>accurate info in its last 3 or 4 issues on the STe and TT. Most of what I'v
>seen on this newsgroup about the TT and STe has bordered on rumormongering
>(not to put any of you down, it's just hard to keep track of all the gossip
>spread).

Actually, according to Bob Brodie of Atari Corp, much of the STart article on the TT was inaccurate, based on obsolete information. Apparently no one at STart bothered to contact Atari prior to publication to verify the content of the article.

The TT is STILL not finalized, so *anything* you read about its specification or capabilities is "rumor"...

Maybe *someday* our children will be able to tell us what a TT is really like...

Well, I used to think like this too. I figured, "Great, I save few bucks now and I figure out all the little problems on my own and put up with a lot of ragged software." This was all well and good until I actually got a Mac IIcx. Now I have speed, support from the manufacturer, oodles of support from third party software companies and hardware companies, easy RAM upgrades, easy hardware add-ons, etc. Now that I have one, I think it was worth the up-front cost to avoid all the later exasperation and disappointment. Anyway, I guess the old addage holds true: You get what you pay for.

p.s. Richard, lighten up. :-)

GEMINI works fine on my system, with Tos 1.4. When I Exit out of
GEMINI, however, it looks for something called MULFEL.PRG. Can anyone
tell me what this is, and what it does, and if it is suppose to be in
the ZOO which I obtained from wuarchive.wustl.edu? I have a file
called MULFEL.MUP...what is the relation? Also, I recall a message
about the original GEMINI.INF file (or whatever it is named). Does
anyone have it...can they post it? GEMINI seems to work real nice,
bravo, looks great in mono.

And now for a really dumb question: What is INFO-ATARI Digest ?

Also, since I haven't gotten replies for some old questions, I will
ask them here to save room:

Is there a program to control drive speed on a 5.25 inch drive that
works with TOS 1.4?

Where can SPECTRE GCR be obtained? My local distributor is having a
problem getting it.

Thanks...

[discussing the books that you can get about programming the ST...]

>Where's the beef??
>
>Well, for one there is the still the fact that no NEW ST book has
>been published in the USA for 2 years.

And GEM and GEMDOS haven't changed much in the past 2 years, either. Let's see, TOS 1.4 added one new GEM call, and changed the file selector? Yes, it's nice to see more comprehensive documentation come out, but it isn't *necessary*. Your ability to write GEM programs hasn't disappeared because there aren't any new books describing the old calls.

>And the fact, that even Greg admits, that you can't buy *ANY* ST book
>in the major bookstores.

Right. But the complaint I've seen here so far is, "Atari should bring out docs because the ones we have are shit!" Atari bringing out docs won't put ST books into Waldenbooks. Only bigger sales of ST books will put ST books into Waldenbooks. The problem you have with ST books is the same one you have with ST software and ST peripherals.

>Greg, are you on a paid retainer by Atari Corp??

No. Someday you might learn that people can disagree with you without being paid by the evil opposition. I criticize Atari Corp about a lot of things, but at least I make sure I'm not spewing hot air when I make a criticism.

>But where do you go for info on programming for GDOS?? GDOS is one big
>black hole as far as Atari Corp is concerned. It isn't covered in any
>C book that I have. And programmers are all having problems writing
>GDOS printer drivers.

GDOS calls are documented in my version 1 Abacus book. The major problem with them is that they aren't labeled as such. However, it seems other programmers haven't been unable to write GDOS applications. GDOS printer drivers I have not seen documented, but allegedly Atari sells such documentation. I'd love to see 3rd party documentation about this. Definately a small hole that needs filling.

>So, where's the beef?? I would answer "In Sunnyvale!!"

Amazing how we can take the same facts and come to a different conclusion. Maybe now you understand why I like ZNet a lot better than

I like ST Report. And why I read the Washington Post instead of the
World Weekly News.

Have a nice day.

Well, looking at the doc's (I'm a second semester German student, and it helps with stuff from Germany), anyway, the docs also said that it requires a meg of memory. I only have TOS 1.0, so i haven't dug to far into the docs.

2304. SIMMs for the STE

Newsgroup: comp.sys.atari.st
Date: 1990-03-04 19:24:30 UTC
From: euaanu@eua.ericsson.se
Message-ID: <2703@erix.ericsson.se>
Source record: 242898

I've just tested 1M x 8 SIMMs from a Mac IIcx in my 520 STE. IT WORKED!!!
I took out the 256k x 8 SIMM (150 ns) and replaced them with two
1M x 8 (80 ns) made by Samsung. Then I booted up and checked with a DA
the amount of memory installed. 2048k it said!!!
Then I tried to add my own SIMMs to the two free sockets. When
I booted, it rebooted, rebooted ..... So it seems that you can't
mix the 1M and 256k SIMMs.

Here's the pinout for the SIMM if anybody is interested:

1 +5V
2 CAS
3 D0
4 A0
5 A1

6 D1
7 A2
8 A3
9 GND
10 D2

11 A4
12 A5
13 D3
14 A6
15 A7

16 D4
17 A8
18 A9
19 -
20 D5

21 WE
22 GND
23 D6
24 -
25 D7

26 -
27 RAS
28 -
29 -
30 +5V

I found an article in BYTE Jan 88 (Ciarcia's circuit cellar, BCC180 computer)
with a SIMM in the schematic. The article number for that SIMM (a 256k x 8)
was HB 561009A. I checked that my SIMM had the same pinout (except for
pin 18 which is only on 1M SIMMs).

So now you know.

2305. Re: PC DITTO II

Newsgroup: comp.sys.atari.st
Date: 1990-03-04 21:18:30 UTC
From: ignac@electro.UUCP
Message-ID: <1448@electro.UUCP>
Source record: 242899

hey guys. i thought the world was a great place friday when i finally!!!
received pc ditto II. well, i finally got around to installing it today, and
hey, what do you know, it don't work worth a damn. my major concerns are:

the installation manual refers to a user's manual, which was not in the
box, and there is no user manual info in the installation manual. sheesh.

the installation manual refers to a program called PCD2DIAG.PRG which is
supposed to be on the master disk, but again, no such luck. just the
same sort of files from pc ditto I (ie: pcdmenu (which hasn't even been
updated since pcdI, or at least it looks that way). this is disturbing since
i wouldn't mind knowing what is wrong with the installation (i am assuming
that it is the pal problem since it gets as far as reading the ibm boot
sector, and then it dies)

other observations:

my god, what a big bloody board they're using!!!!! it might as well be a
complete ibm for its size! i originally heard that it was supposed to be
the size of the clip to the 68000. of course the manual doesn't say how or
where it's supposed to mount inside the ST since i can't seem to find
a natural place for this monstrosity.

the cables are skewed and twisted over one another. sheesh. double sheesh.

well, until i get them updated pals, i guess the old st will have to be in
this opened, dishevelled state. unfortunately for avante garde, the whole
deal looks quite unprofessional, and the problems with leaving out entire
manuals/programs mentionned in the installation guide leaves a lot to be
desired!

just a few disgruntled thoughts ...

> HP's version of UNIX. Would anyone like to do that? :-)

Yes, a SysV version would be amusing... but what about a newer version
of the one we already have? I would sincerely love to see some sort
of file transfer besides simple capture. Also, I hate adm3a
emulation! Editing files is really awful because the terminal type
lacks certain commands.

Also, in my version... to get rid of the title bars.. and the scroll bars...
I have to switch them to ON, not off... that seems backwards.

2307. Quick ST II Press Release (LONG!)

Newsgroup: comp.sys.atari.st
Date: 1990-03-04 21:57:41 UTC
From: ignac@electro.UUCP
Message-ID: <1449@electro.UUCP>
Source record: 242951

The following (long) article is the press release posted on GEnie and Compuserve last Friday describing Quick ST II and further upcoming products from Branch Always Software. If you feel that this article is inappropriate here in comp.sys.atari.st, then feel free to hit 'n' NOW and yell at me using email. If you feel interested, please read on!!! The Quick ST II demo will appear in comp.sys.atari.binaries within a week (i hope!)

Press release for immediate distribution to all Atari ST users.
By Darek Mihocka and Ignac Kolenko of Branch Always Software.
March 2, 1990. (C) 1990 Branch Always Software.

****

Branch Always Software presents...

Quick ST II Quick Tools
Quick ST II Demo

****

Hello from Canada! For a few weeks now we've been hinting that today would be the day that we would announce some new products, and we certainly don't want to disappoint anyone. We have information about our new products, Quick ST II and Quick Tools, as well as a look back at the good and the bad of 1989. This announcement is about 7 pages long, so pour yourself a cold one, grab a chair, sit down, and start reading.

The first Quick ST was just voted the best shareware program of 1989 by the readers of ST WORLD (U.K.) magazine. We hope these new products will rank high in the commercial categories for the 1990 vote.

Quick ST II - Software Screen Accelerator and Desktop Customizer
---

Price: $19.95 U.S., $22.95 Canada, 19.95 U.K. Now shipping.

Quick ST II is a major enhancement of the Quick ST software accelerator, and includes 5 new screen utilities. Quick ST II is a must have package for anyone concerned with the performance of their ST. It includes:

- version 2.0 of the Quick ST software screen accelerator,
- the Quick ST II Desktop Customizer,
- the Art-ST graphics editor,
- version 1.8 of the Quick View fast file viewer, and,
- version 1.8 of the Quick Index speed benchmarker.

Quick ST 2.0 speeds up text and GEM screen output, which makes most GEM or text based programs redraw faster, respond faster, and thus run

faster. Compared to earlier versions of Quick ST, version 2.0 is up to 100% faster, and is now compatible with almost all ST software.

Quick ST 2.0 is a software accelerator. That means that it requires no hardware modifications, replacement of ICs, or voiding of warranties. Quick ST 2.0 does its job by making TOS more efficient at outputting text and graphics to the screen. It runs on all STs, from TOS 1.0 to TOS 1.6, color or monochrome, blitter or no blitter.

In most cases, there is a 200% to 300% increase in the speed of screen output. This was verified by not one, but three different screen benchmarking utilities (including our own Quick Index). This is even faster than the performance of hardware accelerators. How is this possible? A good hardware accelerator (such as the T16 board) can only provide about a 50%-100% speed increase, and those cheaper boards are only good for about a 10%-30% speed increase. But instead of using this brute force approach, Quick ST 2.0 replaces slow screen drawing code in TOS (which contains a lot of compiled C) with small and fast assembly language code. In one case (printing strings of text to a color monitor) our code is over 15 times faster that that originally found in TOS.

Quick ST 2.0 now makes even better use of the blitter chip (if present), so that even machines that do have blitter chips will execute GEM faster.

If a hardware accelerator is present, Quick ST 2.0 still provides almost the same level of speed increases as without the board. In fact, the combined performance of a Mega ST containing a T16 accelerator and Quick ST 2.0 almost equals the performance of the Atari TT! (Based on benchmark figures of TOS 3.0, the version of TOS found in the TT).

Quick ST 2.0 has many other features. It supports the 19 inch Moniterm monitor, making the large screen faster than ever. It is compatible with the Atari Monitor Driver and ZZ Driver, and also works with other high resolution screen drivers.

Quick ST 2.0 uses only 20K of RAM, which is a lot less than most other utilities, which makes it ideal for use on 512K or 1 meg systems. Even the Control Panel uses more memory!

Quick ST 2.0 runs from the AUTO folder. Simply copy Quick ST 2.0 to the AUTO folder of your boot disk and reboot. It is not copy protected, for easy installation on a hard disk. Once installed, Quick ST 2.0 is invisible and worry free.

Quick ST 2.0 supports the installation of custom desktop backgrounds and fonts, to make your ST feel more friendly. Any DEGAS compatible medium resolution or monochrome picture can be installed.

Like other software accelerators and the blitter chip, Quick ST 2.0 can only speed up well behaved applications (programs that do not bypass TOS). This excludes most video games, 8-bit, Mac, and PC emulators. Quick ST 2.0 does not significantly speed up low resolution (320x200 mode) since most well behaved applications do not run in low resolution.

The only other product that comes close to Quick ST 2.0's abilities costs more than twice as much as Quick ST 2.0, uses twice as much memory as Quick ST 2.0, doesn't support the Moniterm, has trouble supporting custom backgrounds and fonts, and most of the time isn't even faster than Quick ST 2.0. There has never been a better time to get Quick ST!

The Quick ST II Desktop Customizer is a companion program for Quick ST 2.0, which allows for the installation of custom background patterns and desktop images. Although there are other public domain and commercial utilities that install custom desktop images, none of them are as fast, as easy to use, or support the installation of background patterns (which saves memory).

Here's how it works. When you first turn on your computer, Quick ST 2.0 checks its configuration. It will be in one of three modes:

- normal green or gray desktop background
- custom pattern
- custom background image (requires an extra 32K of RAM).

A custom pattern allows you to replace the solid green (in color) or gray (in monochrome) desktop background with your own custom designed pattern. No extra RAM is required. We liked the way this feature looked on the Mac, so we just had to give the ST this ability too.

The third option loads a DEGAS compatible picture into memory, and uses it as the desktop background. Most GEM based programs will also use this background image. There are plenty of images that can be on the desktop. Calendars, reminder messages, digitized pictures, or just plain bizarre drawings.

The Desktop Customizer, which runs as either a desk accessory or as a regular program, allows the user to instantly change modes, from normal background to custom fill to custom image, to load, edit, and save patterns, and to load desktop images. The desktop background can be changed as often as one wants, without rebooting the computer. And all configuration information is written directly into the Quick ST 2.0 files. There is no renaming of files required, and the desktop image files (.PI2 or .PI3 DEGAS pictures) can be located anywhere on the disk.

The Desktop Customizer contains a built-in pattern editor, and as the pattern is edited, it is displayed on the whole desktop. On a color monitor, the pattern can include up to 4 colors.

To help users create that desktop image that is just right, Quick ST II includes the Art-ST shareware graphics editor, by Robert Birmingham. Users of Quick ST II are encouraged to use this program and send a small shareware contribution to the author, who will then provide an update. Art-ST has all the features needed, including circles, boxes, text, cut and paste, and is compatible with DEGAS files.

The fourth program in the Quick ST II package is Quick View 1.8. This latest version of our text file reader runs as both a desk accessory or as a regular program, and can also be installed to replace the desktop's

"Show Print Cancel" function. Simply double click on any text file and it will quickly be display in 80 columns, and in 25 or 50 rows (in mono). No other text file viewer can flip back and forth through a text file as fast as Quick View.

Use Quick View to read README files, online magazines, source code, or any other text, or near text file. Quick View supports standard ASCII, UNIX text files, and Atari 8-bit text files. Because it can run as a desk accessory, it is possible to do things like read documentation files while running a GEM program.

Readers of ST Report online magazine will especially like the built-in table of contents generator. Just load in an issue of ST Report, press the Tab key, and instantly get a table of contents of the entire issue. Then just press a letter to choose a topic, and Quick View instantly jumps to that article. Nothing could be simpler!

The fifth program in the package is Quick Index 1.8, an upgrade to our famous benchmarking utility that is used the world over to benchmark hardware and software upgrades for the Atari ST. Quick Index 1.8 has been expanded with reference benchmarks for the new Atari STe.

Quick Index benchmarks your computer in various categories: CPU performance, disk drive performance, and screen output performance. Quick Index will show you just how much slower your ST is without Quick ST. It can also be used to test various hardware accelerators.

Quick Tools Volume 1 - Useful Utilities And The Quick Manager
---

Price: $19.95 U.S., $22.95 Canada, 19.95 U.K. Available in April.

Quick Tools Volume 1 is the second commercial offering by Branch Always Software. It is a collection of 9 different multi-configurable utilities (that term will be explained below!) plus the Quick Manager. The package includes the following programs (most are version 2.0):

- Quick View (smart file viewer)
- Quick Find (fast file finder, catalogs disks)
- Quick Label (label printing utility /w mail merge)
- Quick Inf (DESKTOP.INF file editor)
- Quick Env (system environment editor)
- Quick Index (the de-facto Atari ST benchmarking software)
- Quick CLI (simple but powerful command line interface)
- Quick Control (our own easy-to-use control panel)
- Quick Lock (drive & partition read/write protector)
- Quick Manager (manages Quick Tools, calls file selector, displays time, date, TOS version, free RAM)

As stated above, each Quick Tool is multi-configurable. This is a term we use to describe a program's ability to work as either a desktop application (which can be double clicked from the desktop), a desk accessory (loadable at boot time) or as a Quick Manager Overlay, by

simply renaming the filename extension.

But you may be wondering, "what is a Quick Manager Overlay???" This question is most easily answered by explaining the function of the Quick Manager itself. When we started creating more and more Quick Tools, we realized that sooner or later, somebody would try to install them all as desk accessories and run out of room. GEM only provides support for 6 desk accessories at a time on the desktop's menu bar. What was required was a program to manage the Quick Tools, and so Quick Manager was created.

The Quick Manager is desk accessory which enables the user to load and run any of the Quick Tools as if they were desk accessories, but without using any desk accessory slots. The secret lies in the fact that Quick Manager has its own drop down menu for installing up to 16 overlays.

A Quick Manager Overlay is simply a Quick Tool installed for use with Quick Manager. It can be considered to be both a desk accessory and an application, and has the benefits of both. It can be called up any time the Quick Manager accessory is visible (such as from the desktop or from within another GEM program), and unlike regular desk accessories, overlays are not permanently memory resident.

In fact, Quick Manager itself uses only 15K of memory, and with all of the Quick Tools installed, less than 60K of memory is used!

Every one of the other Quick Tools is multi-configurable. So the user can run each Tool in one of three ways: as a standard desk accessory, as a standard application, or as an overlay. Remember that there is a substantial savings of memory when using overlays.

Almost any desk accessory can be converted into a Quick Manager Overlay. Any developers interested in converting their desk accessories over to Quick Manager Overlays can contact us for more information.

But Quick Manager does use a desk accessory slot itself. So to make up for this, Quick Manager has other features which themself replace several commonly used desk accessories. Quick Manager can call up the file selector at any time by simply clicking on the "FSel" button on Quick Manager's window. Users of custom file selector programs can thus call up their favorite file selector with a single mouse click.

Quick Manager also displays the current time and date, version of TOS, and free RAM. The time/date display is user configurable, and all configuration information (including the position of Quick Manager's window) can be saved.

Hopefully, this gives you a flavor for the functionality of the Quick Manager and the concept of overlays and multi-configurable utilities. As Branch Always Software develops further releases of Quick Tools they will easily become a part of your desktop configuration.

Now, a few words about the individual Quick Tools themselves.

Quick View 2.0 is the latest generation viewing program for the Atari ST. It will automatically determine what type of file is being viewed, and display that file appropriately. This means that a text file will be displayed as a text file, and a picture will be displayed as a picture, and so on. Even ARCed files are displayed as a verbose listing of the contents. Quick View 2.0 can be thought of as a "smart file viewer".

Quick View 2.0 can be installed to replace the desktop's "Show Print Cancel" function (using another Quick Tool, Quick Inf). Simply by double clicking on any non-program file on the desktop, Quick View 2.0 will load it in and display it appropriately. No more screens of Hebrew characters!

If Quick View 2.0 can't recognize the file type, the file can be viewed in hex mode, raw ascii, or as raw graphics. This is ideal for examining files at the byte level.

Quick Find 2.0 is a fast file searching utility. If you have ever wondered, "where is that .DOC file", you can find it using Quick Find 2.0. It has the ability to search any combination of drives and partitions simultaneously, with informative directory style output going to the screen, printer or any filename you wish. Searches can be done on any drive, or even subdirectory within a drive. As well, a "non-recursive" search may be done if you do not wish to search into subdirectories. Quick Find 2.0 can completely scan all the the directories on a 20 meg hard disk in only 5 seconds!

But wait, that's not all. Quick Find 2.0 also allows group file modifications as well. This means that you can write protect, hide, touch, delete or even set the TOS 1.4/1.6 fast file load bit on any group of files you search for. And that's just a short list of possible operations available.

Quick Label 2.0 is a multi-purpose label generation system. It has 10 buffers to handle even the biggest of multi-label jobs you can dream of. It has provision to create and load any printer driver, plus has a full suite of text editing commands to make that label look as slick as can be. It also contains a very simple to use mail merge facility, so the generation of mailing labels is a snap with Quick Label 2.0. It too can be configured as an installed application which acts on *.LAB files (the label files generated).

Quick Inf 2.0 is the Atari ST DESKTOP.INF file editor. It allows you to edit the normally uneditable features of the desktop, such as drive search masks (have you ever wanted a window to display only *.DOC files when looking for the document you want to edit?), or the default installed text file reader. (An ST fact: when you click on a text file, any program you wish can be given that file rather than the standard "Show Print Cancel" utility built into the desktop! It's just that up until now, you couldn't change it unless you knew exactly what line in the DESKTOP.INF file to change!)

Thus, with Quick Inf 2.0, you can customize your desktop with simple button clicks, and even save and load multiple versions of your favourite

desktop configuration! This is a real boon to multi-user STs: each user can have their own .INF file and by configuring Quick Inf as an installed application, you can simply double click on any *.INF file to change the desktop configuration. It's that easy!

Quick Env 2.0 is another handy utility since it allows the user to alter and edit, load or save the current system environment strings. This is especially useful for program development since all compiler information can be placed into the environment strings, negating the need to use a bulky command line interpreter to run your favourite compiler. More down to earth users will appreciate the ability to take all your program's resource files (*.RSC files) and place them in a subdirectory, and edit the system environment string which tells the ST where to find these files. Never again worry about remembering where those pesky resource files reside!

Quick Index 2.0 is of course, the de-facto benchmarking utility for the Atari ST, as described under Quick ST II. Quick Index 2.0 has Quick Manager support.

Quick CLI 2.0 is a small but useful command line interpreter which has the advantage of being able to run as an accessory. It contains a complete suite of commands including DIR, COPY, RENAME, DELETE and a host of other commands which make life easier in those moments when the desktop just won't do. Also, Quick CLI 2.0 supports changes to the system environment strings, as well as supporting the new Atari ST Extended Commandline Specification released a few months ago. Since Quick CLI 2.0 is multi-configurable, you can even run it as a desk accessory, for those emergency file operations (such as having to clear out space on a disk before saving an important file).

Quick Control is, as the name suggests, our own Control Panel. It allows complete customization of the standard system parameters, but, since it's a Quick Tool, you can run it in any of the three ways described earlier. Use it to change the time and date, edit screen colors, change the baud rate, reconfigure the printer, and many more things.

And finally, Quick Lock 2.0 is the drive/partition protection program. It allows the user to select drives or partitions available to the system and either write protect them, read/write protect them (which makes that drive basically locked to the outside world) or leave them alone. It also has password protection so that you can lock your system, and leave your ST unattended until you come back and enter your passoword to unlock the system. This is especially useful for protecting a multi-user system from prying eyes.

Hopefully the above information allows you to get a feel for the power and versatility that the Quick Tools package offers.

Look for the Quick Tools Demo, soon to be uploaded to online information services and bulletin boards everywhere.

Quick ST II Demo

A lot of Quick ST users have commented that they didn't fully appreciate what Quick ST did for them until they had to use a computer without it. It's like trading in 10 speed bike for a 3 speed bike. They thought something was wrong, because everything became a lot slower, but then they realized that Quick ST was not installed.

We would like all Atari ST users to experience this, so we have released a demo of Quick ST II. The demo package includes demo versions of Quick ST 2.0 and the Desktop Customizer, and several sample desktop patterns and pictures.

This demo is now available for download from the Atari ST libraries of the online services Compuserve, GEnie, Delphi, BIX, and Usenet. We expect that it will soon be available from most Atari ST bulletin boards as it gets copied around by other users.

A disk containing the demo can also be ordered from us.

The demo has certain limitations, otherwise it wouldn't be a demo. For one thing, the demo runs slower than the real thing, but still considerably faster than just plain old TOS. The demo of the Desktop Customizer has all Save options disabled. The demo displays a prompt to remind you that it is a demo, and also uses more than 20K of RAM. To get the full speed 20K no limitations version, simply buy Quick ST II.

Speaking of demos, be sure to drop by the Branch Always Software booth at the Second Canadian Atari Users Convention, being held on April 1 in Toronto, Canada, at the Airport Hilton. The show is being put on by the Toronto Atari Federation user group, and promises to be a blast. Later in April, catch us at the Atari show in Pittsburg.

Our products will also be on sale at the World Of Atari show in April.

Ordering and Upgrading

We are expanding our dealer network, so that the new software will be available through more dealers in Canada, the United States, and the United Kingdom. We should have dealers in other European countries soon.

Quick ST II is now shipping and should be available at all dealers within a few weeks. Then we will begin shipping Quick Tools, and also release the Quick Tools Demo to the public. As we found out the hard way, it is impossible to ship two products simultaneously when both members of Branch Always Software are also trying to write exams and graduate from college. So bear with us. Two more months and we're free!

If for some reason your Atari dealer does not stock our products, or you just wish to order direct, send a check or money order to our address:

Branch Always Software
PO Box 2624, Station B

Kitchener, Ontario
Canada N2H 6N2

In Canada or the U.S., add $3 for postage and handling. In the U.K., add 2. All other countries, add $5. We accept payment in Canadian dollars, U.S. dollars, and pound sterling. For fastest service, please enclose the correct amount. Residents of Ontario, please add 8% tax.

A disk containing the Quick ST II Demo and the Quick Tools Demo is available for $2, plus postage and handling as above.

We are also setting up a VISA card order line, and we will ship just about anywhere in the world. If calling from outside of North America, remember to dial the appropriate codes for Canada.

Order line: 519-570-4340
Inquiries: 519-747-0386

Registered users of Quick ST can upgrade to Quick ST II for the usual $3 upgrade fee and by sending back their original disk. This only applies to users who have already sent in their registration cards. If you haven't, we don't know about you yet.

Registered users of the Quick Utilities can receive an upgrade disk containing the Quick Tools. The cost is $3 and the original disk.

All previous discount offers and upgrade offers have expired. Any shareware contributions received will be treated as orders, provided that the correct amount is sent.

Please call our inquiries line for more information.

>find all the nasty characters in the corrupted file), and when I transfer
>files from the HD to floppy (the floppy files get corrupted). *This problem
>doesn't happen when I use the standard desktop!*

When you first reported problems with The Vault and The Key, I was trying my hardest to figure out what might be wrong with the software. Now that you are experiencing the same problems with GEMINI, I think it's pretty clear that the problem is not with software but with your hardware. I would suspect your memory upgrade. There is probably some bad memory somewhere. The Vault makes use of all available memory to copy files, so if any memory was bad, corrupted files would be likely. GEMINI uses memory not used by the normal desktop, so it's not surprising that GEMINI might run into the bad portion of memory whereas the standard desktop does not.

I suggest you run a careful memory test. Then, if you do determine that your problems were due to hardware that you report this fact back on the net so that the thousands of people who read your original postings about problems with The Vault and with Gemini can relax and benefit from those programs.

2309. GDOS question

Newsgroup: comp.sys.atari.st
Date: 1990-03-04 23:12:10 UTC
From: foster@cbnewse.ATT.COM
Message-ID: <13366@cbnewse.ATT.COM>
Source record: 242953

I need a question about GDOS answered. I have a program that I wrote some time ago which copies a graphic image into a window as part of it's operation. This has worked out just fine for a long time but since I have added GDOS to my system, the blit call doesn't cause anything to happen. If I take out GDOS(or G+PLUS), everything works fine again.

The call in question is a
vro_cpyfm(handle,3,xyarray,&sourcemfdb,&destmfdb);

Is there some sort of initialization that needs to be done with GDOS-G+PLUS in addition to the appl_init(), v_opnwrk(..),vs_clip(..) stuff? The program doesn't use GDOS but something about GDOS being loaded is messing things up. Any GDOS tips appreciated.

Thanks,
Bob Foster

2310. Dead On Boot Up

Newsgroup: comp.sys.atari.st
Date: 1990-03-05 00:02:00 UTC
From: SOCS18@vaxb.york.ac.UK
Message-ID: <9003050806.AA15910@ucbvax.Berkeley.EDU>
Source record: 242954

The ST will crash if you hold down mouse buttons while booting because the mode of the IKBD chip is read from the same port that the buttons are attached to at reset. With both buttons released, this mode is zero, as it should be. The ROM in the IKBD can't cope with any other status, so when the buttons are down, it's goodbye keyboard controller...

Regards,
Mat.

2311. STE display hardware

Newsgroup: comp.sys.atari.st
Date: 1990-03-05 00:14:00 UTC
From: SOCS18@vaxb.york.ac.UK
Message-ID: <9003050806.AA15885@ucbvax.Berkeley.EDU>
Source record: 242955

OK folks, it's STE programming time again...

Data from "Atari STE Developer Information Addendum", addresses in hex, sizes
in bits (in table)

Video Harware Modifications
==========

Addr Access Size Use
====== ====== ==== ==========
FF8204 R/W 6 Video address counter (high)
FF8206 R/W 8 Video address counter (middle)
FF8208 R/W 8 Video address counter (low)
The change here is that these registers are now
read and write, allowing the programmer to
update the video refresh address to any word
boundary _at any time_.

FF820C R/W 8 Video base address (low) (VBASELO) This register
didn't exist on the ST, but on the STE it allows
the positioning of the screen base address on
any _WORD_ boundary

FF820E ?? 8 Line offset (LINEWID) - the number of extra words
added to the address counter at the end of each
line, _MINUS ONE DATA FETCH_. This allows for
virtual screens that are wider than the actual
screen display. Clearing this register means the
STE acts like an ordinary ST.

FF8240 to FF825E Colour palette
There are now four bits for each of the red,
green and blue components. To give backward
compatibility with the ST, the least significant
bit is above the most significant bit. Thus the
register layout is as follows:

xxxx 0321 0321 0321; x=don't care
RED GRN BLUE

FF8264 ?? 4 Horizontal bit-wise scroll (HSCROLL). Allows the
start of each line to be delayed by 0-15 bits,
thus giving instant horizontal scrolling.

Horizontal fine scrolling isn't quite as trivial as it looks. The pixel offset
is loaded into HSCROLL, and the documentation then says the following about
the LINEWID register :

"If you are actively scrolling (HSCROLL<>0), this register should contain the additional width of the display line _minus one data fetch_ (in low resolution one data fetch would be four words, one word for monchrome etc.)"

The reason for the extra data fetch becomes clearer if you think about what is actually happening. If you fine scroll by n bits, then n bits are effectively missed off the left hand edge of the screen. But to get a complete line of pixels, n bits must be added to the right hand side of the screen. This constitues one extra data fetch for the display processor beyond the usual requirement.

For example, if you had three low resolution pictures side by side in memory, and you wanted to scroll across them, you would set LINEWID to 160 when HSCROLL=0 (no extra data fetch). When HSCROLL<>0, LINEWID would be set to 156 (four less due to the extra data fetch done automatically by the display processor).

Vertical scrolling is trivial - simply set the video address base to the required address at horizontal blanking time.

That's all folks - for now - more info on the new controller ports soon.

2313. Questions On Graphics/One Month?

Newsgroup: comp.sys.atari.st
Date: 1990-03-05 01:07:07 UTC
From: S54394GR@ETSUACAD.BITNET
Message-ID: <9003050822.AA16796@ucbvax.Berkeley.EDU>
Source record: 242957

Hi all,

got a few questions about graphics on the ST.
First of all, I have a file which is broken up into several
UUE files. I need to know how to get them all together and uudecode
I have no trouble uuding single files, but I can't figure out how
to get these together.

Next, can GIF files be converted to DEGAS instead of SPC?
If so , does anyone have the prg to do this?
Can SPC be converted to DEGAS and if so, does any have this prg?

Which GIF's should be converted (in your opinion, I guess) to SPC and
which to DEGAS?

Are there any MACPaint files (.MAC) or Amiga low/med res pictures (.IFF)
available in the bitnet world? (FTP?)
Is there anyway to un-HQX Mac files w/o a Spectre or other emulator?
Are there any .SND files for REPLAY available through FTP?

I called a few places that advertised the TT, STE, STACY (START mag is
great on all this!) and most have told me about a month. Can anyone
support or deny this? Could these machines really be available to
mail order within the month?

Finally, can anyone give me an ~ price on the STACY (1,2, or 4, whatever)
and STE computers?

```

>Where can SPECTRE GCR be obtained? My local distributor is having a
>problem getting it.
>Thanks...

purchased my Spectre GCR from 1st Stop Computer Systems in Dayton. Ohio.
I ordered it last Monday, and received it on Thursday.... since UPS takes
that long just to ship from Ohio to Florida, it must have gone out the same
day.... If anyone is interested, their number is 1-800-252-2787. I don't know
whether or not they handle overseas orders, but anyone interested could try
writing them at 1st Stop Computer Systems Ltd
7085 Corporate Way
Dayton, OH 45459
USA

Their prices are very reasonable ....

Also , someone was looking for a program to change the step rate of a drive
under TOS 1.4 ... DCFORMAT will allow you to write an executable boot sector
which will change the drive speed on either drive. Just write this boot sector
to a disk and boot from it to set ur drive speed. I tried this along with my
hard drive boot program (ICD 4.5.1) and a program called CAUTO.PRG which allows
one to boot from a floppy, and then run auto folder programs and/
or accessories from the hard drive.... E-mail me for more info..

It means you have an outdated version of poolfix. Use poolfix3.prg.
It's been posted here a couple times in the past month. If you don't
find it, mail me a message and I'll send it to you.

Well, I would like to add that holding down BOTH mouse buttons
during boot will make the keyboard processor (6301) enter external ROM mode.
It looks for ROM chips which the ST doesn't provide so of course it crashes.
So, if anyone says their ST crashes at boot when they hold both mouse buttons
down, say: "It's supposed to do that!".. just another note...
dlh@raider.MFEE.TN.US

Any questions? (You can buy a piggyback RAM upgrade to about 8K for the 6301)

> reflect those of Atari Corp. or anyone else. ...ames!atari!apratt

I'm currently working on a math analysis / display program (read:
infinitely complex fractal program with delusions of grandeur) and might
end up using timer C for internal purposes. However, the only reason I
can see for this causing a problem (ie peripheral access) is precisely
what I'll be avoiding.

As I see it, most of the programs that would break (you suggested
games, demos, and such) are unlikely to rely too heavily on Bconout and/or
disk access. Besides, application writers have three other timers to use
as they see fit. A 200hz timer isn't likely to be of much use in a game
anyhow, would it? Wouldn't that be a bit slow?
Of course I could be wrong. But I can't see any problems with the
change; to me, any program which changes timer C already risks messing up
GEMDOS, so it a little extra chaos won't matter that much.

->
->Apple advertises a great deal more than Atari. I saw one report that 40% of
->Apple's income goes to advertising. Not a trivial amount.
->
-> Jeff
That's true. Of course the bottom line goal of advertising is to sell
more systems. Selling more systems results in a larger user base.
A larger user base means that there are more people that want to
buy information. More people wanting to buy information means that
Apple can charge less, per person, for that information. It's all
a vicious circle.

2322. Running the MIDI ACIA at 500KHz

Newsgroup: comp.sys.atari.st
Date: 1990-03-05 05:51:10 UTC
From: dmb@wam.umd.edu
Message-ID: <1990Mar5.055110.10206@wam.umd.edu>
Source record: 242966

I notice that it's possible to change the clock divider value for the ACIAs, meaning that, in theory, one could run the MIDI port at 500K baud. Normally, the divider is 16: 500KHz / 16 = 31250 baud. Setting the divider to 1 would give a 500KHz clock = 500K baud.

Has anyone experimented with this? My initial attempt at this causes the machine to hang, but that might be because the OS code to handle the interrupts is not fast enough to handle that data rate (e.g., the buffer may be too small).

Am I re-inventing the wheel, or attempting the impossible?

Thanks all,

Dave Baggett
dmb@cscwam.umd.edu

2323. Another umoria teaser

Newsgroup: comp.sys.atari.st

2328. Sozobon C

Newsgroup: comp.sys.atari.st
Date: 1990-03-05 10:40:25 UTC
From: D.M.Johnson@newcastle.ac.uk
Message-ID: <1990Mar5.104025.1994@newcastle.ac.uk>
Source record: 242972

This has most likely been on the net before so replies to this query
should be Emailed if possible.

Query.. I have just got a copy of Sozobon C and began to right of
couple of programs for it. One of these programs was a simple screen load
program to swap between screens stored in memory. This program required the
use of the Gemdos function Malloc, however the complier refused to complie.
Thinking that this was a fault in the program I just entered I entered this
very small program:

```
#include <stdio.h>
#include <osbind.h>

main()
{
long address;
address=Malloc(-1);
printf(address);
}
```

The complier returned with Malloc failure.

I am doing something wrong or is there a bug in the complier? If it is
a bug is there a way round it.

Thanks in advance

Dave

2330. no shareware mac emulator (long)

Newsgroup: comp.sys.atari.st
Date: 1990-03-05 11:46:40 UTC
From: capitain.pad@nixpbe.uucp
Message-ID: <1345@nixpbe.UUCP>
Source record: 242974

To anyone who's been interested in the shareware mac emulator...

Apologies that you didn't hear anything from me for months, but
I've been too busy with my `real' work. Here's the state of the
project:

I decided NOT to release the 64K version, mainly because there
was almost no interest in the emulator (at least on usenet). I
got something around 40 answers :(
I also realized that most of the software on MacWorld's top ten
list requires the Plus Roms to run without patches, so I think of
Aladin as a good piece of work, but to be realistic, with only
64K Roms it's an out-of-date piece of work.

I'm still planning to re-design the emulator and to support Plus
Roms, mainly for my own usage. I don't know if I'll have time to
do it and when it will be finished, but if it is, I think I will
release it as shareware, maybe together with source code, but -
again - I don't know when I'll do it...

In an old message Dave Small wrote:

> If I may ask -- can the story of the development of Aladin be told?
> I remember the name Mathias Greve, and something about two brothers who
> did the original product; I'm not familiar with the shareware offerer's
> name. I'd like to hear it if you'd care to tell it.

Here it is:
since the first day I heard of Apple's Lisa, I was fascinated of its
user interface. But as a student, I never have been able to buy one,
even after the release of the Mac. (In Germany, Apple's prices are much
higher than in the US.) Some guys near my home town (two brothers,
Matthias and Michael Greve) had kind of rich parents and bought a mac
in '84. At first, I wasn't able to look `into' the Mac - with only
MacPaint and MacWrite at hand, but then came Microsoft Basic! Now I
could write a program like the Apple]['s monitor rom, and I was able
to get a disassembled listing of the 64K roms and of the system files.
I started to comment this listing, which has been hard in the beginning,
but Apple released more and more information about the Mac's internals,
finally `Inside Macintosh'. By the time, I got a very thorough knowledge
of the Mac's OS.
The Greve brothers (the Mac owners) had a small software company named
`ProficomP', trying to sell some Apple][games, without much success.
They got the idea of a 2MB battery powered memory board for the first
512K Macs. I wrote the software for this board, that allowed to use part
of it as a ramdisk, from which you could boot the system - this saved

hours(!) of time, because back then there was no harddisk... Soon before
we were ready to ship the board, Apple release the Mac Plus, with 1MB
of memory and hard disk support.
:(
In the meantime, Atari released the ST, claiming it to be a `Jackintosh'
but I didn't like it's OS. However, the hardware and the price was great!
I told the Greve brothers of my idea to port the Mac's OS to the ST.
After some arguing on the pro's and con's, I could convince them that
this could be a promising idea. To reward me for the unsuccessful memory
board project they bought me an Atari ST, so I could realize my ideas,
and they wanted to market the final product.
Three months before we wanted to ship, we heard of Magic Sac. After the
first shock we thought of it as a good test for the reactions of Apple.
(We were convinced, that our product would be better. Sorry, Dave :)
Apple showed no interest in the Magic Sac, so we started shipping, too.
Well, the rest should be known.
After 3 months with very, very rapidly growing sales, Apple took us to
court for the first time, with the result that we had to stopp selling
Aladin in Germany. We still could sell it in the rest of Europe, and
there were enough companies out there, who sold Aladin back to Germany
again. After the second lawsuit with Apple in '89 though, the Greve
brothers decided to stop selling Aladin.

I hope not to waste bandwidth, but I'd like to add some personal remarks
on the Aladin history:
since the beginning of the product, the Greve brothers thought of Aladin
as their product. Everybody (like Dave) knew them and the name of their
company, but not me. I simply was the `programmer'. Yes, it has been my
fault to tolerate this, but I hoped for the future to change this.
I always had trouble with the Greve brothers to get my part of the
company's income. That was the reason why I decided to quit the development
of Aladin in '88. I never could tell at the end of a month whether I could
pay the rent for my appartment or not, and my wife and I didn't want to
live like that. I went to Nixdorf, a German computer manufacturer and
started working on UNIX, what I'm doing still. Until mid '89, however, I
also worked on Aladin at home, just because the Greve brothers had no one
else who really was able to make major imrovements to Aladin.

Now I'm really out of the Aladin business. A couple of weeks ago I had to
go to an attorney, because the Greve brothers don't want to pay me my part
of Aladin's income in '89. There's a German proverb, meaning "friendship
ends, when it comes to money", and that's just a description of the
development of our relationship.

Sounds a bit like resignation? That's true. I really never thought,
that it could come that far, but it seems to happen more often than I
thought, if you remember Dave's trouble with Data Pacific.

> If any of the makers of Aladin ever make it to Denver, please
> give me a call, okay? Let's go get a beer.

Dave, you should be careful offering (US-)beer to a German, many of them
don't like something else than German beer :) but you can be sure, that
I'll give you a call. I will be in Boston and San Francisco by the end of
the year, but I don't know if we make a stop in Denver. We'll see...

<
<Would you beleive that this has a happy ending? I had just made

Well, it looks like the drive "felt formatted". This happens sometimes;
I know several people who have had these problems. It also happened to
me with the sh205 a few weeks ago. After I had reformatted the drive (of
course!), someone who has faced this problem several times told me of a
way to restore the drive, at least the partitions above c:\. He told me
that usually only the first 8-10 kB were zeroed. So it was possible to
reconstruct the later partitions with a hd-sector-editor like Supra's
supedit.prg. Of course You have to know about the physical structure on
the disk. So it is recommendable to use such a tool to extract the
formatting and partitioning information, write it onto a sheet of paper
and attach that to the case of You drive.

Does anyone (eventually Atari engineers?) know about the reason for this
problem? Even the people mentioned above --- all very experienced, doing
hardware development for the ST and other computers --- had no idea.

Howdy folks!

Interested in buy or selling used computers?

A new magazine is now available as a "shareware" subscription
for the buyer or seller of used/surplus computer and electronics
equipment. The free subscription is offered on a trial basis
for promotional purposes.

The Used Computer Locator is a nationally distributed magazine
for the used computer market. We are reaching users, distributers
schools, universities, and the business world.

For a short time I will offer some free ads.

To readers of the "comp.sys..." groups I will offer 5 classified
ads for each ".sys" group to the first five respondants to this posting.

Please note that if you are a business we will with proper qualifications,
offer some free ads for you also. Call me for further information.

All ads must come by email to me Ken Wilkinson Editor-in-Chief
at {wilk@cinnet.com} or! by fax at (513) 751-6463.

Remember to include an address to mail your copy, and include in
the ad your name and number to be reached.

The ad size is restricted to one (1) column inch, about 35-40 words.

The sections that ads can be appear in are:

Buyers Market
Surplus Electronics
Software Market
Networks, Systems and Mainframes
Wanted Ads
$500 Marketplace

==========

Interested in a free trial subscription?

Email me your full address (US Mail address please!)
and I will put you on the subsription list for the April issue.
Include your telephone number if you wish to be called

for advertizing information.

For any other help I can be reached at the following:

Thanks!

2336. Advice on a RAM upgrade requested

Newsgroup: comp.sys.atari.st
Date: 1990-03-05 15:10:10 UTC
From: rjd@cs.brown.edu
Message-ID: <31530@brunix.UUCP>
Source record: 242980

OK, here's the deal...

I plan on purchasing a TT when/if they ever materialize, but in the meantime, I would like to upgrade my existing ST system without having to buy a new Mega.

I have a 4 year old Atari 520 ST (not one of the old trouble-making originals with the bad power supply and first-off-the-assembly-line revision on the motherboard...this was purchesed during the last half of 1986, and has the second revision motherboard -- revision B, I think? - it's been a few years since I opened it up.)

Anyhow, I piggybacked another half a meg worth of chips on top of the originals shortly after purchase...and there she sits: a 1 Meg ST...chugging along happily for nearly half a decade with no problems, no woes, no mishaps of any kind...now here comes Daddy, and he's gonna open 'er up again like so much oysters...

I would like to bump the memory up to 2.5 Megs. Now, I know what has to be done....that's not the perpose of this inquiry...the question I put forth to y'all is: *should* it be done?

Given the history and age of my machine, will it survive? Will its power supply be able to handle the additional RAM? Has anyone had any problems with older machines and power supply problems to greater thann 1 Meg worth of chips?

Any response is welcome. e-mail it to me below, or, if you think its benificial information for the community in general, just post it...but a quick response is required, I have an itchy soldering finger...

Thanks in advance...

The cdecl keyword in Turbo C forces arguments to be passed on the stack
rather than in the registers. ie:

int cdecl (*_shell_p)( char * cmd );

If you could pass this on to the net, I'd appreciate it.

The reason the call is there is that you are DEAD if the disk fails.

I suspect that you are trying to scan the disk for bad sectors, and don't
want the message. If so, try OR-ing 0x8 to the command word. Supra
and or ICD use this to turn off retries, and I would suspect it will also
stop the dialog box call as well.

2342. Floating Point Wierdness with Sozobon C

Newsgroup: comp.sys.atari.st
Date: 1990-03-05 18:29:00 UTC
From: latornell@mech.ubc.ca
Message-ID: <301*latornell@mech.ubc.ca>
Source record: 242986

Consider the following piece of code:

```
#include <stdio.h>
#include <fplib.h>
main()
{
float a;
FILE *fopen(), *infile, *outfile;

infile = fopen("test2.dat", "rt");
outfile = fopen("test2.out", "wt");
fscanf(infile, "%f", &a);
fprintf(outfile, "a = %f\n", a);
fclose(infile);
fclose(outfile);
exit(0);
}
```

I use the command line "cc -vf test2.c" to compile this with
Sozobon C version 1.1 and the libm.a library from fplib2.0.
If test2.dat contains:
0.01000000000
(that's 9 0s after the 1) the result in test2.out is:
a = 0.010000
and everything is fine. But, if I add a 0 to the contents of test2.dat:
0.010000000000
the result in test2.out is:
a = 0.001410

The value that stored in "a" seems to change with the value in test2.dat but I can't correlate the changes. I'm pretty sure the problem is with fscanf() because this problem arise initially in a program that reads data from a file into a struct and uses v_pline() to display the data (after minor manipulation). That program worked fine when compiled with Megamax C.

Can anyone a) reproduce the results described above and b) suggest an explanation?

Although I haven't tested this theory exhaustively, I think that fscanf() freaks out when the field it is reading contains more than 13 characters. Why this should be is beyond me. I haven't yet delved into any of the compiler or library source code and am definitely *not* looking forward to doing so.

BTW, my system configuration is:
1040STF (built in DS floppy) ca late 1986

TOS 1.0 in ROM
ST296N disk connected via ICD host adapter
using Gulam shell to drive Sozobon C
AUTO folder contains: copyfix.prg
icdtime.prg
idle12.prg
multivec.prg
uis_ii.prg

I use Kermit all the time when transfering from VAX to the ST. I use Uniterm
2.0e and I use the KERMIT utility on the VAX and not FTP or someother way. I
also always use a ramdisk and I never encountered the problem - maybe the disk
you are using is full? or is the protect tab opened? When I use KERMIT on the
vax I tell it to go into server mode then I do all the stuff through Uniterm.
It seems that may be a hardware problem, maybe a cable is loose or something.
Try to use a ram disk and then copy the files to the disk manually...

Re : Preventing "Data is damages in drive..." dialogue.

I believe that you have to nobble the critical error handler vector (evt_critic, I think) which is in the $4xx region, and documented in the Abacus book. I haven't tried this, but I think that if you make it point to an RTS you won't get the dialogue. Sorry this is so vague, but I'm quoting from memory here.

Re : Mixing 256 and 1M SIMMs in the STE

In the lastest edition of ST World (English version) there is an ad. from a company offering cheap SIMM upgrades for STE owners. The mention that the 520 STE has two 256K SIMMs fitted, while the 1040 STE has one 1M SIMM, and that you can't mix the two. They offer to "upgrade" your 520 STE to 1Mb by selling you a 1Mb SIMM, and buying back your 256K SIMMs for (wait for it) 10 pounds each!

They also offer 520 STEs upgraded to 1Mb for less than the price of a 1040 STE!

Re : Bitblt failure with GDOS

What device handle are you using when you do your v_opnvwk call? You must use the one returned by graf_handle if you're opening a screen workstation, or you'll get no end of GDOS problems.

Re : AC_CLOSE messages

GEM sends all accessories AC_CLOSE messages when an application ends. This means you get one when a program is launched from the Desktop (because the Desktop program has now finished), or when you quit any other program. By writing a little program that popped up an alert when it received AC_CLOSE, I found that the AC_CLOSE message usually gets sent well after the program has actually finished. For example, after quitting any program and returning to the Desktop the "AC_CLOSE received" alert didn't appear until just before the Desktop opened its first window.

This effect could be due to the fact that GEM won't let the accessory display its alert until the main application makes some GEM calls (this is cooperative multitasking remember). Any comments?

From: bds@lzaz.ATT.COM
Message-ID: <940@lzaz.ATT.COM>
Source record: 242992

My main beef with the multisync in hi-rez mode is what I term "shadowing".
I see characters and lines "echoed" in a fashion like that seen on TVs.
The problem is not too bad in reverse video mode. I suspect the cause is
the ganging of a 9 pin gender changer and 9 to 15 pin adapter to get
the NEC 3D to talk to the video box I have. Even without that problem the
Multisync is not as sharp as a true monochrome monitor.

I use the Nec multisync GS. The GS is a monochrome , black & white
monitor. The picture is as good as the Atari monochrome. I think
it cost me about $270 last year. I like it. It does not have a
speaker. The Nec color multisync in monochrome mode on the Atari
is good but not as nearly as good as the GS.

Monochrome picture grading:
Nec GS multisync A
Atari monochrome monitor A
Nec color multisync B
Atari color monitor c+

Are you sure that you are using the right handle? You get a physical
handle from calling gr_handle, and the you pass that handle into
v_opnvwk to get the virtual handle, and you use that virtual handle
for further VDI operations. I believe I saw a posting once which said
that the physical and virtual handles are the same without GDOS and
different with GDOS, but I can't seem to find my copy. In any case, a
a little experimentation ought to get your answer.

Good luck!

Message-ID: <1187@oucsace.cs.OHIOU.EDU>
Source record: 242801

After days and days of using FW+ in an attempt to get the
Phantom to appear, I finally did it. Unfortunately, I didn't have my
logic probe with me right there, but I did manage to get it after the
machine had bombed (four bombs; don't remember whether that's bus error
or what).
Anyhow, counting from the top end of the connector, the values
I got were:
L
H
H
P
H
(gap in connector)
P
H

"L" and "H" are Low and High. P indicates a pulse. Let me explain:
at first, there was no data on P (I think it was high). Then I pressed
the spacebar, and I got a "make" pulse and a "break" pluse. After
doing this twice more, the pulses all of a sudden didn't stop -- they just
kept on coming.
I have no idea whether this is an accurate representation of what
was actually going on, because I think I might have had the probe set in
CMOS rather than TTL. I'm connecting a buffer and a set of LED's for
further verification so I don't have to type with my ST's case off.
Anyone out there have a logic analyzer they'd be willing to send
me for further testing???

I've got an Adaptec controller / 65meg RLL setup which I'd like to
use for Spectre GCR if/when I buy it. The ICD host adaptor tells me that
because the Adaptec uses FAT bad-sector mapping rather than SCSI, I shouldn't
use it with Spectre. But I do have a few error-free partitions. Can I use
Spectre with these partitions?
A more broad question is, what goes wrong when you have a bad sector
on your hard disk? Surely there's a Macintosh equivalent of mapping out bad
sectors to a FAT table that can be done.

I use a NEC Multisync 3D, which has resolution up to about 1024 by
800 or so. It's beautiful in color, even better than the Atari in my opinion,
and the monochrome also looks better (IMHO) though I don't use it all that
often yet because I rigged the cable and it gets a lot of noise.
The reason I suggest NEC is becuase NEC monitors are pretty much
the standard; they also have a good user base, and I've had few problems.
One thing to make sure -- especially if you're using the monitor for photo-
graphic use -- is to test it out in the store before you buy it (yes, I know
it's cheaper mail-order). The reason is (actually this applies to ANY
monitor) that in transport, the magnets on the CRT might have been knocked
a wee bit out of convergence, leading to one corner being skewed. Or you
might have a bit of color misconvergence. In my case the first monitor I
got suffered from this (also a NEC 3D) but that was because the guy at the
store dropped the box.
One good thing about the NEC 3D is that it'll work with whatever you
give it: 60Hz color, 50Hz color (including overscan), monochrome, extended
resolutions in the (somewhat vaporous?) STE, and even interlaced if you want
to rig that up (it can be done, tho I'm still working on it!). Also, the
vertical resolution is so high that I can step the screen down one scanline
at a time, and with time-exposure photography, get 640 x 600 in color! (The
scanlines step about three times before ending up overlapping).
The only disadvantage I can think of for the 3D is that it's not a
flatscreen monitor, if this matters to you. It's about the same curvature
of the Atari I think.
BTW, there are oodles and oodles of different ways to hook up the
cable for this monitor. I think there's an article in terminator.cc.umich.edu
about making the proper cable; if not, just play around with it. The monitor
chooses its sync based on the incoming signals, although certain options
control how monochrome is handled (as a "color" signal or as an IBM-like
monochrome signal. Choose the former; the latter tends to be fuzzy).
Oh yes -- one bonus -- you can even use it for a high-quality TV,
if you have an NTSC-to-RGB decoder, because it takes composite sync inputs
as well as split horizontal and vertical. In fact, I think it'd work
directly off a black-and-white signal, because it has a "green-composite-sync"
input. Of course, your TV screen would be green, but maybe you like it

that way.
Just think about HDTV!

Disclaimer: I have no affiliation with NEC other than as a satisfied customer.

There are two that I know of, both pirated. One is called MacBongo, from
germany. It is an old 64k rom hack (roms saved to disk). The other is
a pirated version of Spectre 128, with v 1.85 software. It bombs quite
frequently, to my understanding. Both are quite illegal.

Greg Lindahl says:

> ... Atari bringing out docs
>won't put ST books into Waldenbooks. Only bigger sales of ST books
>will put ST books into Waldenbooks.

Er, umm... actually, when Atari asks little third-party developers,
"What can WE do to help you", the most overwhelming answer is:
"SELL MORE STs!"

Thus the REAL solution to the above situation is:

"Atari bringing out docs won't put ST books into Waldenbooks. Only bigger
sales of *ST COMPUTERS* will put ST books into Waldenbooks."

I was riding home from work last night on the subway in San Francisco.
My commute home is pretty long, and so I play video games on my Lynx
to pass the time.

On the subway, a couple across the aisle from me noticed that I was
playing with some sort of game they'd never seen before. When they
leaned over to look at it, I offered to show it to them. The male
member of the couple asked me how much the Lynx cost versus the
GameBoy, and remarked about the color and better graphics.

The woman said to me, "Does Atari make that? I thought they went out
of businesss!" To which I replied, "No, they're still around."

Sounds like Atari could stand to do a bit of advertising for itself,
let alone its products.

2370. Geneology Programs -- a summary of responses

Newsgroup: comp.sys.atari.st
Date: 1990-03-06 14:35:37 UTC
From: hcj@lzsc.ATT.COM
Message-ID: <1360@lzsc.ATT.COM>
Source record: 242814
Cross-posted to: comp.sys.atari.st,comp.sys.ibm.pc,comp.sys.mac

I recently requested from the net information on Geneology Programs.
I have and Atari, but also emulate MAC and PC. So I was interested with
all three as sources. This started when My Uncle sent me a data base on
FHS (Family History System, IBM). It worked, but seemed clutzy. (see
other comments below). I downloaded both GEN_PLUS and RELTREE (both ST)
from Genie. GEN_PLUS is build on a data base program and kept crashing.
RELTREE also screwed up quickly on my entries. It seemed very confused
about establishing families.

All three were much more interested in index numbers rather than names
as keys to the system. I did not like this.

The Major responses were that The Mormon Church underwrites a program
Personal Ancestral File (PAF). This is availiable for IBM and MAC.
($35 and THEY pay the shipping). I bought the MAC version. Its very
nice.

Below are comments from the many responders. I thank you all for writing.

hcj@lzsc.att.com

=======COMMENTS from WRITERS ====
The best genealogy program on the market is

FAMILY ROOTS
Quinsept, Inc.
P.O. Box 216
Lexington, MA 02173
1-800-637-ROOT or (617) 641-2930

I have it and it's a pleasure to use and it'll do anything you'd
ever want to do in terms of genealogy. The support is also
great and there is even a Quinsept User Group to help out. Give'em
a call and they'll send you information on their line of genealogy
software (which runs on everything from IBM PC, Macintosh, Apple][,
Commodore 64/128, TRS-80, etc. all optimized to their platform, but
with exchangable databases)

I recently downloaded (from CompuServe; GO ROOTS), a shareware program called
"Brother's Keeper." I have tried several "free" genealogy packages, and until
now, have found them cumbersome to use and unable to handle "special"
situations (e.g. multiple spouses).

There are many genealogy packages available. There are several tolerable PD packages out there, but for $35 you can buy a first-rate package called Personal Ancestral File (PAF) that the Mormon Church publishes. You can order by phone - call the Latter Day Saints' Family History Library in Salt Lake City and they can probably direct you to the right people.

(The Mormons are heavy into genealogy for religious reasons, but they are remarkably nice about helping all us J. Random family historians, too...)

COMMSOFT up in the Bay Area somewhere publishes Roots III, which is arguably the cadillac of genealogy packages. If you buy it from them it will cost around $300 (depending on what utilities you order), but you can save $50 by ordering from one of the mail order catalogues.

I used PAF until I had about 2500 people on file, then switched to Roots because I wanted the fancy footnoting and book-generating features it has. (That's right - Roots III will turn your data into a formatted, publishable family history...)

MAC & IBM PC:
There are two good ones. One is Personal Ancestral File from
The Church of Jesus Christ of Latter Day Saints (The Mormons)
GEnealogical Cept
Ancestral File Operations Unit
50 East North Temple St
Salt Lake City, UT 87150

Costs $35 for which you get a reasonable manual, 3 or 4 program disks and extra disks and labels for your data and backups. It's a great bargain for the money. Quite a competent program, easy to use, well developed with no tremendous bugs in it.

The other one that's really excellent--much more flexible and adaptable is Roots III. However, it costs $300.

MAC:
I have written a genealogy stack for people who do much research. It will keep track of family, individual, and pedigree records, as well as having templates for raw data, such as marriage, birth, census, etc. It is called Genealogy 1.1 and is available on any of the main online services. For keeping record of formal data in family record and pedigree form, as well as some research notes, I recommend the Personal Ancestral File program put out by the Church of Jesus Christ of Latter-day Saints.

I haven't used the stack, but there is a geneology hypercard stack in the info-mac/hypercard directory at sumex-aim.stanford.edu. If you don't already know, you can do anonymous ftp to that site. Hope this helps. You may want to seek out someone who has used it, though.

I recently posted this same query to the net and was inundated with replies. 99% said use "PAF- Personal Ancestor File" from the Church of the Latter Day Saints (the mormons).

It is only 35 dollars (plus shipping) and is really great. Though it
is a port of a PC program it is very well done. Very Mac'ish. Entry
and editing are extremely good. There are lots of output options.
It is oriented towards printing Pedigree charts (ie show me a tree
of my ancestors). It can print descendant charts (more like
traditional family trees) but thse are printed as nested text, not as
a tree.

On the PC there is a shareware program called Brothers Keeper that
will take the files generated by PAF (these files have aparently become
the standard genealogy interchange format) and print a traditional
family tree.

THe only drwaback is that the database entries are weighted towards Mormons.
Their are entries for baptism, bonding-to-spouse, and other christian/mormon
rituals. THere is a commercial product (name escapes me at the moment but it
is advertised in the back of all the usual Mac Magazines) that is supposedly
a liscenced version of PAF that has been extended to better support non-mormons.
The problem is they want more than $150 for it, which seems a bit out of line
given the price of PAF.

IBM PC PROGRAM:
I am using a shareware program called Family History. The entry is
simple.
Editing is no problem, just reference the record number assigned by
the program which corresponds to the individual. To make your own
life easier, print out a list of names and record numbers so you do
not have to constantly refer back to the screen which provides that

The software package I have is PAF 2.2 from the LDS church. It doesn't have
any fancy pull-down menus and stuff like that but it sure does the job.

###############
The following is the 'midifileformat' you requested from the midi-archive
###############

Subject: Standard MIDI Files

From: czei@accelerator.eng.ohio-state.edu (Michael S. Czeiszperger)

Standard MIDI Files 0.06 March 1, 1988

0 Introduction

This describes a proposed standard MIDI file format. MIDI files contain
one or more MIDI streams, with time information for each event. Song,
sequence, and track structures, tempo and time signature information,
are all supported. Track names and other descriptive information may be
stored with the MIDI data. This format supports multiple tracks and
multiple sequences so that if the user of a program which supports
multiple tracks intends to move a file to another one, this format can
allow that to happen.

This spec defines the 8-bit binary data stream used in the file. The
data can be stored in a binary file, nibbleized, 7-bit-ized for
efficient MIDI transmission, converted to Hex ASCII, or translated
symbolically to a printable text file. This spec addresses what's in
the 8-bit stream.

We'd like to make MIDI Files 1.0 happen as soon as possible, so please
respond soon with any comments or proposals you have about MIDI File
transmission, the MIDI meta-event event or any other comments or
questions you have about anything in this specification.

Please direct comments to:

Dave Oppenheim
Opcode Systems

1024 Hamilton Court
Menlo Park, California 94025
(415) 321-8977

1 Sequences, Tracks, Chunks: File Block Structure

Sequence files are made up of chunks. Each chunk has a 4-character type and a 32-bit length, which is the number of bytes in the chunk. On the Macintosh, data is passed either in the data fork of a file, or on the Clipboard. (The file type on the Macintosh for a file in this format will be "Midi".) On any other computer, the data is simply the contents of the file. This structure allows future chunk types to be designed which may easily be ignored if encountered by a program written before the chunk type is introduced. Your programs should expect alien chunks and treat them as if they weren't there.

This proposal defines two types of chunks: a header chunk and a track chunk. A header chunk provides a minimal amount of information pertaining to the entire MIDI file. A track chunk contains a sequential stream of MIDI data which may contain information for up to 16 MIDI channels. The concepts of multiple tracks, multiple MIDI outputs, patterns, sequences, and songs may all be implemented using several track chunks.

A MIDI file always starts with a header chunk, and is followed by one or more track chunks.

MThd <length of header data>
<header data>
MTrk <length of track data>
<track data>
MTrk <length of track data>
<track data>
...

Track Data Format (MTrk chunk type)

The MTrk chunk type is where actual song data is stored. It is simply a stream of MIDI events (and non-MIDI events), preceded by delta-time values.

Some numbers in MTrk chunks are represented in a form called a variable-length quantity. These numbers are represented 7 bits per byte, most significant bits first. All bytes except the last have bit 7 set, and the last byte has bit 7 clear. If the number is between 0 and 127, it is thus represented exactly as one byte.

Here are some examples of numbers represented as variable-length quantities:

Number (hex) Representation (hex)
00000000 00
00000040 40

```
0000007F 7F
00000080 81 00
00002000 C0 00
00003FFF FF 7F
00004000 81 80 00
00100000 C0 80 00
001FFFFF FF FF 7F
00200000 81 80 80 00
08000000 C0 80 80 00
0FFFFFFF FF FF FF 7F
```

The largest number which is allowed is 0FFFFFFF so that the variable-length representation must fit in 32 bits in a routine to write variable-length numbers. Theoretically, larger numbers are possible, but 2 x 108 96ths of a beat at a fast tempo of 500 beats per minute is four days, long enough for any delta-time!

Here is the syntax of an MTrk chunk:

<track data> = <MTrk event>+

<MTrk event> = <delta-time> <event>

<delta-time> is stored as a variable-length quantity. It represents the amount of time before the following event. If the first event in a track occurs at the very beginning of a track, or if two events occur simultaneously, a delta-time of zero is used. Delta-times are always present. (Not storing delta-times of 0 requires at least two bytes for any other value, and most delta-times aren't zero.) Delta-time is in some fraction of a beat (or a second, for recording a track with SMPTE times), as specified in the header chunk.

<event> = <MIDI event> | <sysex event> | <meta-event>

<MIDI event> is any MIDI channel message. Running status is used: status bytes may be omitted after the first byte. The first event in a file must specify status. Delta-time is not considered an event itself: it is an integral part of the specification. Notice that running status occurs across delta-times.

<meta-event> specifies non-MIDI information useful to this format or to sequencers, with this syntax:

FF <type> <length> <bytes>

All meta-events begin with FF, then have an event type byte (which is always less than 128), and then have the length of the data stored as a variable-length quantity, and then the data itself. If there is no data, the length is 0. As with sysex events, running status is not allowed. As with chunks, future meta-events may be designed which may not be known to existing programs, so programs must properly ignore meta-events which they do not recognize, and indeed, should expect to see them. New for 0.06: programs must never ignore the length of a

meta-event which they do recognize, and they shouldn't be surprised if it's bigger than they expected. If so, they must ignore everything past what they know about. However, they must not add anything of their own to the end of a meta-event.

<sysex event> is used to specify a MIDI system exclusive message, or as an "escape" to specify any arbitrary bytes to be transmitted. Unfortunately, some synthesizer manufacturers specify that their system exclusive messages are to be transmitted as little packets. Each packet is only part of an entire syntactical system exclusive message, but the times they are transmitted at are important. Examples of this are the bytes sent in a CZ patch dump, or the FB-01's "system exclusive mode" in which microtonal data can be transmitted. To be able to handle situations like these, two forms of <sysex event> are provided:

F0 <length> <bytes to be transmitted after F0>
F7 <length> <all bytes to be transmitted>

In both cases, <length> is stored as a variable-length quantity. It is equal to the number of bytes following it, not including itself or the message type (F0 or F7), but all the bytes which follow, including any F7 at the end which is intended to be transmitted. The first form, with the F0 code, is used for syntactically complete system exclusive messages, or the first packet an a series Q that is, messages in which the F0 should be transmitted. The second form is used for the remainder of the packets within a syntactic sysex message, which do not begin with F0. Of course, the F7 is not considered part of the system exclusive message. Of course, just as in MIDI, running status is not allowed, in this case because the length is stored as a variable-length quantity which may or may not start with bit 7 set.

(New to 0.06) A syntactic system exclusive message must always end with an F7, even if the real-life device didn't send one, so that you know when you've reached the end of an entire sysex message without looking ahead to the next event in the MIDI file. This principle is repeated and illustrated in the paragraphs below.

The vast majority of system exclusive messages will just use the F0 format. For instance, the transmitted message F0 43 12 00 07 F7 would be stored in a MIDI file as F0 05 43 12 00 07 F7. As mentioned above, it is required to include the F7 at the end so that the reader of the MIDI file knows that it has read the entire message.

For special situations when a single system exclusive message is split up, with parts of it being transmitted at different times, such as in a Casio CZ patch transfer, or the FB-01's "system exclusive mode", the F7 form of sysex event is used for each packet except the first. None of the packets would end with an F7 except the last one, which must end with an F7. There also must not be any transmittable MIDI events in-between the packets of a multi-packet system exclusive message. Here is an example: suppose the bytes F0 43 12 00 were to be sent, followed by a 200-tick delay, followed by the bytes 43 12 00 43 12 00, followed by

a 100-tick delay, followed by the bytes 43 12 00 F7, this would be in the MIDI File:

F0 03 43 12 00
81 48 200-tick delta-time
F7 06 43 12 00 43 12 00
64 100-tick delta-time
F7 04 43 12 00 F7

The F7 event may also be used as an "escape" to transmit any bytes whatsoever, including real-time bytes, song pointer, or MIDI Time Code, which are not permitted normally in this specification. No effort should be made to interpret the bytes used in this way. Since a system exclusive message is not being transmitted, it is not necessary or appropriate to end the F7 event with an F7 in this case.

2 Header Chunk

The header chunk at the beginning of the file specifies some basic information about the data in the file. The data section contains three 16-bit words, stored high byte first (of course). Here's the syntax of the complete chunk:

<chunk type> <length> <format> <ntrks> <division>

As described above, <chunk type> is the four ASCII characters 'MThd'; <length> is a 32-bit representation of the number 6 (high byte first). The first word, format, specifies the overall organization of the file. Only three values of format are specified:

0 the file contains a single multi-channel track
1 the file contains one or more simultaneous tracks (or MIDI outputs) of a sequence
2 the file contains one or more sequentially independent single-track patterns

The next word, ntrks, is the number of track chunks in the file. The third word, division, is the division of a quarter-note represented by the delta-times in the file. (If division is negative, it represents the division of a second represented by the delta-times in the file, so that the track can represent events occurring in actual time instead of metrical time. It is represented in the following way: the upper byte is one of the four values -24, -25, -29, or -30, corresponding to the four standard SMPTE and MIDI time code formats, and represents the number of frames per second. The second byte (stored positive) is the resolution within a frame: typical values may be 4 (MIDI time code resolution), 8, 10, 80 (bit resolution), or 100. This system allows exact specification of time-code-based tracks, but also allows millisecond-based tracks by specifying 25 frames/sec and a resolution of 40 units per frame.)

Format 0, that is, one multi-channel track, is the most interchangeable representation of data. One application of MIDI files is a simple

single-track player in a program which needs to make synthesizers make sounds, but which is primarily concerned with something else such as mixers or sound effect boxes. It is very desirable to be able to produce such a format, even if your program is track-based, in order to work with these simple programs. On the other hand, perhaps someone will write a format conversion from format 1 to format 0 which might be so easy to use in some setting that it would save you the trouble of putting it into your program.

Programs which support several simultaneous tracks should be able to save and read data in format 1, a vertically one-dimensional form, that is, as a collection of tracks. Programs which support several independent patterns should be able to save and read data in format 2, a horizontally one-dimensional form. Providing these minimum capabilities will ensure maximum interchangeability.

MIDI files can express tempo and time signature, and they have been chosen to do so for transferring tempo maps from one device to another. For a format 0 file, the tempo will be scattered through the track and the tempo map reader should ignore the intervening events; for a format 1 file, the tempo map must (starting in 0.04) be stored as the first track. It is polite to a tempo map reader to offer your user the ability to make a format 0 file with just the tempo, unless you can use format 1.

All MIDI files should specify tempo and time signature. If they don't, the time signature is assumed to be 4/4, and the tempo 120 beats per minute. In format 0, these meta-events should occur at least at the beginning of the single multi-channel track. In format 1, these meta-events should be contained in the first track. In format 2, each of the temporally independent patterns should contain at least initial time signature and tempo information.

We may decide to define other format IDs to support other structures. A program reading an unfamiliar format ID should return an error to the user rather than trying to read further.

3 Meta-Events

A few meta-events are defined herein. It is not required for every program to support every meta-event. Meta-events initially defined include:

FF 00 02 ssss Sequence Number
This optional event, which must occur at the beginning of a track, before any nonzero delta-times, and before any transmittable MIDI events, specifies the number of a sequence. The number in this track corresponds to the sequence number in the new Cue message discussed at the summer 1987 MMA meeting. In a format 2 MIDI file, it is used to identify each "pattern" so that a "song" sequence using the Cue message to refer to the patterns. If the ID numbers are omitted, the sequences' locations in order in the file are used as defaults. In a format 0 or 1

MIDI file, which only contain one sequence, this number should be contained in the first (or only) track. If transfer of several multitrack sequences is required, this must be done as a group of format 1 files, each with a different sequence number.

FF 01 len text Text Event
Any amount of text describing anything. It is a good idea to put a text event right at the beginning of a track, with the name of the track, a description of its intended orchestration, and any other information which the user wants to put there. Text events may also occur at other times in a track, to be used as lyrics, or descriptions of cue points. The text in this event should be printable ASCII characters for maximum interchange. However, other character codes using the high-order bit may be used for interchange of files between different programs on the same computer which supports an extended character set. Programs on a computer which does not support non-ASCII characters should ignore those characters.

(New for 0.06). Meta event types 01 through 0F are reserved for various types of text events, each of which meets the specification of text events(above) but is used for a different purpose:

FF 02 len text Copyright Notice
Contains a copyright notice as printable ASCII text. The notice should contain the characters (C), the year of the copyright, and the owner of the copyright. If several pieces of music are in the same MIDI file, all of the copyright notices should be placed together in this event so that it will be at the beginning of the file. This event should be the first event in the first track chunk, at time 0.

FF 03 len text Sequence/Track Name
If in a format 0 track, or the first track in a format 1 file, the name of the sequence. Otherwise, the name of the track.

FF 04 len text Instrument Name
A description of the type of instrumentation to be used in that track. May be used with the MIDI Prefix meta-event to specify which MIDI channel the description applies to, or the channel may be specified as text in the event itself.

FF 05 len text Lyric
A lyric to be sung. Generally, each syllable will be a separate lyric event which begins at the event's time.

FF 06 len text Marker
Normally in a format 0 track, or the first track in a format 1 file. The name of that point in the sequence, such as a rehearsal letter or section name ("First Verse", etc.).

FF 07 len text Cue Point
A description of something happening on a film or video screen or stage at that point in the musical score ("Car crashes into house", "curtain opens", "she slaps his face", etc.)

FF 2F 00 End of Track
This event is not optional. It is included so that an exact ending point may be specified for the track, so that it has an exact length, which is necessary for tracks which are looped or concatenated.

FF 51 03 tttttt Set Tempo, in microseconds per MIDI quarter-note
This event indicates a tempo change. Another way of putting "microseconds per quarter-note" is "24ths of a microsecond per MIDI clock". Representing tempos as time per beat instead of beat per time allows absolutely exact long-term synchronization with a time-based sync protocol such as SMPTE time code or MIDI time code. This amount of accuracy provided by this tempo resolution allows a four-minute piece at 120 beats per minute to be accurate within 500 usec at the end of the piece. Ideally, these events should only occur where MIDI clocks would be located Q this convention is intended to guarantee, or at least increase the likelihood, of compatibility with other synchronization devices so that a time signature/tempo map stored in this format may easily be transferred to another device.

FF 54 05 hr mn se fr ff SMPTE Offset (New in 0.06 - SMPTE Format specification)
This event, if present, designates the SMPTE time at which the track chunk is supposed to start. It should be present at the beginning of the track, that is, before any nonzero delta-times, and before any transmittable MIDI events. The hour must be encoded with the SMPTE format, just as it is in MIDI Time Code. In a format 1 file, the SMPTE Offset must be stored with the tempo map, and has no meaning in any of the other tracks. The ff field contains fractional frames, in 100ths of a frame, even in SMPTE-based tracks which specify a different frame subdivision for delta-times.

FF 58 04 nn dd cc bb Time Signature
The time signature is expressed as four numbers. nn and dd represent the numerator and denominator of the time signature as it would be notated. The denominator is a negative power of two: 2 represents a quarter-note, 3 represents an eighth-note, etc. The cc parameter expresses the number of MIDI clocks in a metronome click. The bb parameter expresses the number of notated 32nd-notes in a MIDI quarter-note (24 MIDI Clocks). This was added because there are already multiple programs which allow the user to specify that what MIDI thinks of as a quarter-note (24 clocks) is to be notated as, or related to in terms of, something else.

Therefore, the complete event for 6/8 time, where the metronome clicks every three eighth-notes, but there are 24 clocks per quarter-note, 72 to the bar, would be (in hex):

FF 58 04 06 03 24 08

That is, 6/8 time (8 is 2 to the 3rd power, so this is 06 03), 32 MIDI clocks per dotted-quarter (24 hex!), and eight notated 32nd-notes per MIDI quarter note.

```
FF 59 02 sf mi Key Signature
sf = -7: 7 flats
sf = -1: 1 flat
sf = 0: key of C
sf = 1: 1 sharp
sf = 7: 7 sharps

mi = 0: major key
mi = 1: minor key

FF 7F len data Sequencer-Specific Meta-Event

Special requirements for particular sequencers may use this
event type: the first byte or bytes of data is a manufacturer ID.
However, as this is an interchange format, growth of the spec proper is
preferred to use of this event type. This type of event may be used by
a sequencer which elects to use this as its only file format;
sequencers with their established feature-specific formats should
probably stick to the standard features when using this format.

4 Program Fragments and Example MIDI Files

Here are some of the routines to read and write variable-length numbers
in MIDI Files. These routines are in C, and use getc and putc, which
read and write single 8-bit characters from/to the files infile and
outfile.

WriteVarLen (value)
register long value;
{
register long buffer;

buffer = value & 0x7f;
while ((value >>= 7) > 0)
{
buffer <<= 8;
buffer |= 0x80;
buffer += (value & 0x7f);
}

while (TRUE)
{
putc(buffer,outfile);
if (buffer & 0x80)
buffer >>= 8;
else
break;
}
}

doubleword ReadVarLen ()
{
register doubleword value;
register byte c;
```

```
if ((value = getc(infile)) & 0x80)
{
value &= 0x7f;
do
{
value = (value << 7) + ((c = getc(infile)) & 0x7f);
} while (c & 0x80);
}
return (value);
}
```

As an example, MIDI Files for the following excerpt are shown below. First, a format 0 file is shown, with all information intermingled; then, a format 1 file is shown with all data separated into four tracks: one for tempo and time signature, and three for the notes. A resolution of 96 "ticks" per quarter note is used. A time signature of 4/4 and a tempo of 120, though implied, are explicitly stated.

The contents of the MIDI stream represented by this example are broken down here:

```
Delta Time(decimal) Event Code (hex) Other Bytes (decimal)
Comment
0 FF 58 04 04 02 24 08 4 bytes: 4/4 time, 24 MIDI
clocks/click,
8 32nd notes/24 MIDI clocks
0 FF 51 03 500000 3 bytes: 500,000 5sec per quarter-note
0 C0 5 Ch. 1, Program Change 5
0 C0 5 Ch. 1, Program Change 5
0 C1 46 Ch. 2, Program Change 46
0 C2 70 Ch. 3, Program Change 70
0 92 48 96 Ch. 3 Note On C2, forte
0 92 60 96 Ch. 3 Note On C3, forte
96 91 67 64 Ch. 2 Note On G3, mezzo-forte
96 90 76 32 Ch. 1 Note On E4, piano
192 82 48 64 Ch. 3 Note Off C2, standard
0 82 60 64 Ch. 3 Note Off C3, standard
0 81 67 64 Ch. 2 Note Off G3, standard
0 80 76 64 Ch. 1 Note Off E4, standard
0 FF 2F 00 Track End
```

The entire format 0 MIDI file contents in hex follow. First, the header chunk:

```
4D 54 68 64 MThd
00 00 00 06 chunk length
00 00 format 0
00 01 one track
00 60 96 per quarter-note
```

Then, the track chunk. Its header, followed by the events (notice that running status is used in places):

```
4D 54 72 6B MTrk
00 00 00 3B chunk length (59)

Delta-time Event Comments
00 FF 58 04 04 02 18 08 time signature
00 FF 51 03 07 A1 20 tempo
00 C0 05
00 C1 2E
00 C2 46
00 92 30 60
00 3C 60 running status
60 91 43 40
60 90 4C 20
81 40 82 30 40 two-byte delta-time
00 3C 40 running status
00 81 43 40
00 80 4C 40
00 FF 2F 00 end of track
```

A format 1 representation of the file is slightly different. Its header chunk:

```
4D 54 68 64 MThd
00 00 00 06 chunk length
00 01 format 1
00 04 four tracks
00 60 96 per quarter-note
```

First, the track chunk for the time signature/tempo track. Its header, followed by the events:

```
4D 54 72 6B MTrk
00 00 00 14 chunk length (20)

Delta-time Event Comments
00 FF 58 04 04 02 18 08 time signature
00 FF 51 03 07 A1 20 tempo
83 00 FF 2F 00 end of track
```

Then, the track chunk for the first music track. The MIDI convention for note on/off running status is used in this example:

```
4D 54 72 6B MTrk
00 00 00 10 chunk length (16)

Delta-time Event Comments
00 C0 05
81 40 90 4C 20
81 40 4C 00 Running status: note on, vel = 0
00 FF 2F 00 end of track
```

Then, the track chunk for the second music track:

```
4D 54 72 6B MTrk
00 00 00 0F chunk length (15)
```

Delta-time Event Comments
00 C1 2E
60 91 43 40
82 20 43 00 running status
00 FF 2F 00 end of track

Then, the track chunk for the third music track:

4D 54 72 6B MTrk
00 00 00 15 chunk length (21)

Delta-time Event Comments
00 C2 46
00 92 30 60
00 3C 60 running status
83 00 30 00 two-byte delta-time, running status
00 3C 00 running status
00 FF 2F 00 end of track

5 MIDI Transmission of MIDI Files

Since it is inconvenient to exchange disks between different computers, and since many computers which will use this format will have a MIDI interface anyway, MIDI seems like a perfect way to send these files from one computer to another. And, while we're going through all the trouble to make a way of sending MIDI Files, it would be nice if they could send any files (like sampled sound files, text files, etc.)

Goals
The transmission protocol for MIDI files should be reasonably efficient, should support fast transmission for computers which are capable of it, and slower transmission for less powerful ones. It should not be impossible to convert a MIDI File to or from an arbitrary internal representation on the fly as it is transmitted, but, as long as it is not too difficult, it is very desirable to use a generic method so that any file type could be accommodated.

To make the protocol efficient, the MIDI transmission of these files will take groups of seven 8-bit bytes and transmit them as eight 7-bit MIDI data bytes. This is certainly in the spirit of the rest of this format (keep it small, because it's not that hard to do). To accommodate a wide range of transmission speeds, files will be transmitted in packets with acknowledge -- this allows data to be stored to disk as it is received. If the sender does not receive a response from a reader in a certain amount of time, it can assume an open-loop situation, and then just continue.

The last edition of MIDI Files contained a specialized protocol for sending just MIDI Files. To meet a deadline, unfortunately I don't have time right now to propose a new generalized protocol. This will be done within the next couple of months. I would welcome any proposals anyone else has, and would direct your attention to the proposal from Ralph Muha of Kurzweil, available in a recent MMA bulletin, and also directly from him.

> columns o the screen. But this won't work with, say, BOBTERM will it? Upon
> loading of BOBTERM wouldn't the 80column handler cause some sort of crash??

I just set up my configuration for BOBTERM this weekend. It seems like an
excellent program (V1.1) and Bob Puff will definitely get my shareware check
by the weekend.

If you are using Version 1.1 of BobTerm, it allows you to add modules that
give you extra capability. This is supposed to be new for V1.1. I did not
see V1.0 or earlier so I can't say. Anyway, one of the modules that came
with the disk I got from our users group library is a module to allow you
to use the XEP80 with BobTerm. I didn't try it because I don't have one,
but it is available. Might be just what you are looking for.

>the amount of memory installed. 2048k it said!!!
>Then I tried to add my own SIMMs to the two free sockets. When
>I booted, it rebooted, rebooted ..... So it seems that you can't
>mix the 1M and 256k SIMMs.

As far as I can tell Atari have recoded the memory config table.
Testing the bits in the table on an STE give a 512K machine as having
512K in bank0 and 128K in bank 2! This means that it should be
possible to use say 3 1M simms and get 3 MEG of memory. (It may also
be possible to put in 4Mx8 simms if you can find any.) With a small
patch to stop the MMU causing an exception for addresses above 4Meg
the STe _might_ be expandable above the 4Meg limit of an STfm.

[simm pinout deleted]the SIMM if anybody is interested:

Anyone know more about the possibity of more than 4Meg on an STe?

I love GEMINI, it is all one could ask for in a desktop. The only problem I have is when running Gulam from Gemini. It I call gulam, "Gulam.tos" it will run fine in the slow <console> window. But if I call gulam "Gulam.prg" it will clear the screen and run just as iff it was clicked from the desktop. The hitch is, after exiting gulam and getting back to the GEMINI desktop, I cannot renter gulam. It just clears the screen, then pops back to the GEMINI destop. This is killing me. Any thoughts on this????

Source record: 242821

Thanks to all the people which sent me some help with the problem I was having on the Malloc() function. Part of the problem was bad C programming (I am new at the langauge :-)) but in the process of solving I discovered the main cause. It was the set up of the disk

Set up as follows for using Sozobon C on a 512K STFM machine

100K eternal2 RAM drive
Gulam .. latest version
Disk volumes set up as instructed in documentation

When the program is complied with the RAM drive installed it produced the error _malloc error_, this only occured if Malloc() (or malloc()) was included in the program.

Could anybody explain why this has happened

Thanks in advance

Dave

From: david@bdt.UUCP
Message-ID: <1513@bdt.UUCP>
Source record: 242824

OK, I looked through the archives I have, and I saw a lot questions about it, but no answers.

Is there a picture converter utility for the ST which will *output* to some standard format? Specifically I want to convert some DEGAS files to anything standard, such as GEM IMG or Tiff or PCX etc. I have seen PICSW which can import many formats, but it will only output in Atari specific format (NEO/DEGAS). Once I get the pictures into one of the well-known formats mentioned, I have lot's of tools that can manipulate these. I saw at one point a utility to convert to MacPaint. I can even deal with this, becase I have another utility that can convert this to a "real" standard format, but I don't know where to get it.

E-mail and. I'll summarize if there's interest.

Thanks for any help.

I just played the ST version of Space Ace at a computer store here in Columbus. All I have to say is, IT IS INCREDIBLE!!!!!!!!!!!!!!!!!!! The graphics, animation, sound and gameplay are all excellent, not to mention that it loads quite fast which is another plus. There are 33 screens in this game and the five or so that I saw were all great. The game is on four disks, but I don't know how much disk swapping is necessary because I didn't get very far in the couple of minutes they let me play it. I'm one of the lucky people who already ordered it last week, so I should be getting a copy pretty soon, that way I can play it over spring break. So, if anyone out there wants a program to show off their ST, I strongly suggest that they get Space Ace, it's amazing! Long live Atari, may the force be with you, and remember, X NEVER marks the spot.
Jeff

This is just another note. When you hold down both of the ST's mouse buttons during boot, it tells the keyboard processor (6301) to enter "external ROM mode". The 6301 looks for ROM to execute, but the ST doesn't provide it with any chips, so it crashes!

From: ajy2208@ultb.isc.rit.edu
Message-ID: <2344@ultb.isc.rit.edu>
Source record: 242829

Hi everyone,

I need to know how to create region(s) on the screen that are independent from normal screen i/o (mainly, scrolling..). Most terminal programs have a line or two somewhere on the screen that doesn't scroll. Usually these are status displays to show useful information (baud rate, system connected to, various toggles, etc..).

I've searched my wonderful MWC manual, but there's no mention on how to create something to this effect. If I had $250 to plunk down for developer docs, I'd do that. If Atari was more leniant with disclosure of USEFUL information for the ST, I might be able to buy books that describe just what I want to do. In that respect, the 8-bit was much more enjoyable to program than the ST. Hmm, it seems that my request for help is becoming a flame, so I'll cool my jets now..

Hopefully I won't have to write custom screen i/o routines to do this.. Ahh, I wish the ST had a display list.. :-)

Hello.
Sometime back, a document was passed round the net describing
how one takes a IBM PC mouse (non optical I assume) and connect it
to the St. Could someone please repost this doc? I'm in dire need.
To anyone that saw my previous message, and reply'd, please, reply
again. As It musta got lost somewheres between here and someplace
<sigh>.

Several people asked for FAT check programs recently. Just for checking, there is DSKMAP available from panarthea. An update to deal with >16MB partitions has been posted today. This program does no writing, so no repair. However, with some knowledge about FAT and directory structure and just any sector monitor, you can repair by hand, which is in my experience the safest to do.

There is DLII by Simon Poole, which checks and repairs disks, and this has been posted by someone to panarthea, too. However, there are minor bugs (one is an undeleted dataset will have its last sector lost, another is a sector marked bad may be "recovered" as lost under certain circumstances, and there may be more) in this program, and you risk losing your data. Also, I recall Simon told to the net that DLII is not PD.

hope this helps, Roland

> 1.6. So if you have 1.0, thats probably your problem, like mine.

This can't be the problem. Of course Gemini checks the TOS version
and displays an error message on old roms.

Because GEMINI starts programs using shel_write (actually they really
are started witd Pexec...), GEMINI has to tell the desktop which
program to start after the termination of GEMINI. Place a program
called EXIT.PRG in $HOME. This program should do only a Pterm.

>Hmmm, from what I been reading, the main complaint is how Atari is trying
>to restrict technical info on the ST to those who have forked over the
>developers fee. Perhaps this is the REAL reason the publicly available
>docs are "shit!"

Of course the reverse is true in the UK.
Being a registered developer I get to read about the workings of the new STE
in a magazine instead of being told by Atari that there is this new machine
coming out Christmas '89 and would I like some tech details on it.
I spent last December writing, phoning and pestering Atari UK to get 2 year
old developer documentation on the ordinary ST.

I do think that in paying the developers fee you are entitled to information
and support that the ordinary user is denied. What do I mean by that?
Well by information I mean advanced information on unreleased products
such as the TT and special hardware such as Moniterm cards etc.
Support? Phone, newsletters bug fixes, the whole thing.

I have been told, by Atari UK, that the whole developers support is under
a major reorganisation and details will be announced in the near future.

As for posting of development documentation to the net perhaps suffering
typos I quote from Rainbow TOS release notes:-

"The xxxxxx() call is incorrectly documented"

"The documentation for the xxxxxx is wrong."

;
? [26]
! bad pos.
<to be read again>
;
pos->...XPR3)<=currentbreadth:errmessage"bad pos";
fi.fi(x(SUFFIX2)r-x(SUFFIX...
l.138 pickup tiny.nib; pos11(right_curve,0)
;
?
```

Also does any one have the neccessary .MF file for generating the fonts
for the Atari SLM804. Someone posted me a .MF file previously but it
required a couple of files that I've not been able to find - ie. PLAIN.MF
version 1.0a and the corresponding CMBASE.MF - does anyone have them.
The problem relates (I think) to the Atari laser being 'write-white'

```
% stlaser mode: to generate fonts for the Atari ST laser printer SLM804
mode_def stlaser =
proofing:=0; % no, we're not making proofs
fontmaking:=1; % yes, we are making a font
tracingtitles:=0; % no, don't show titles at all
pixels_per_inch:=300; % that's pretty low resolution
```

```
blacker:=-.25; % less blackness
fillin:=.5; % compensate for diagonal fillin
o_correction:=0; % normal overshoot
write_white_engine:=true; % You have to use the modified PLAIN.MF V1.0a
% and the corresponding CMBASE.MF, which has
% to be modified according to TUGboat 1/1987)
enddef;
```

Thanks for any help

2395. Hard disk problems

Newsgroup: comp.sys.atari.st
Date: 1990-03-07 15:33:49 UTC
From: domen@cartan.crin.fr
Message-ID: <1777@loria.crin.fr>
Source record: 242839

Some days ago, my hard disk got completely corrupted: I first noticed
that some files were mixed on the disk and looking at the FATS and the root
directory, I saw that a prt of file was written in the root directory and
some clusters were allocated to more than one file. It's actually the third
time it happens but I never exactly identified the problem before. I have
then two questions:

1/ Does somebody else already had such a problem?
2/ could the Universal Item Selector be responsible for this?

The Universal Item Selector is indeed the only program that were in
use every time this problem occured, and the first time, it occured
immediately after I tried to copy a file with the Item Selector.

Eric

2396. Gemini on old STs

Newsgroup: comp.sys.atari.st
Date: 1990-03-07 16:48:45 UTC
From: dac@ukc.ac.uk
Message-ID: <2873@gos.ukc.ac.uk>
Source record: 242840

I know Gemini doesn't work with TOS versions before 1.2. The question is,
why? Is there any chance of Gemini ever being released for older TOS versions?

I've seen it on a STE and it looks good. However, unless Atari feel like
sending me Rainbow TOS free of charge, I haven't a hope of using it myself.
Ugh... The pains of being a student with no money...

Dave.

Message-ID: <9003080812.AA27742@ucbvax.Berkeley.EDU>
Source record: 242841

I am in need of hardware information on the 6581 sound chip (ie SID in the Commodore 64), in particular the data sheets.

I am also possibly interested in getting hold of some 6581s, but have found them somewhat expensive (around 15-20 pounds), which is made worse by the fact that I may want about 8 of them!! Anyone know where I can get hold of these cheap?? (Apart from by cannibalising old '64s!!)

Thanks for replies re: MIDI data file format.

Marcus Bointon, King's College London.

>board, not so you can add memory to your machine. Sometimes we use
>SIPs, not SIMMs, and they're soldered right into the board! Don't rush
>out and buy a 520STe expecting to be able to upgrade it.

Who should we contact in order to change this policy?

I believe this would be in the interest of saving Atari from becoming a
worldwide laughing stock....

Obviously Atari never bothered to tell UK magazines that the SIMMS
weren't a feature of the machine so when they opened the machine SIMMS
were what they found - can you blame them for assuming this to be a
'feature' of the machine (rather like the square 68000 being a 'feature')?

Amiga owners (sorry!) just take off a panel on their machines and shove in
a 60 quid upgrade. How can the STE be a 'machine for the 90s' if we
still have to fart around with soldering irons or making sure that our
MMU and Shifter are socketed so that we can fit a board???

Mark.

>
>K. Rosenvold, jkr@ifi.uio.no / ...!{uunet,mcvax,sunic}!ifi.uio.no!jkr
>Short signatures R cute.

The current version for the Happy software is 2.7. Happy computers has recently moved, they have new phone numbers, etc.. The phone numbers are:

Office: (916) 268-3595
BBS: (916) 268-9089 (2400-N-8-1)

You can download an ARCed file that will bring your stuff from 2.6 to 2.7. The file is fairly small, but you will of course need an un-ARCer. I have 2.7, if you can't use the BBS, email me.

>7 at 100 nsec. Can I mix the speeds on the same bank??

Yes, go ahead and mix them. FYI the speed ratings are MAXIMUMS. In reality the data comes out much sooner than the rated maximums -- because the maximums have to include low voltage (4.5 volts) and high temperatures (probably 50 degrees C.) and process variations (10%?) and STILL be within maximums. My point is that system designs depend on the chips meeting the maximum requirement -- faster chips do this, but at some point you end up paying for speed capability that you don't need.

Anything under 150ns (what my original Atart 520 ST came with) will work just fine -- mixed or not.

Anyone with the time to write a tiny utility to just grab all the
fat and directory structure, + write it to optionally :
a) file on tracks near other end of disk
b) floppy disk
(to be run before switch off/ at boot time)

An option to grab this info from a sequence of floppy disks would be nice.

- sorry for suggesting more work for others, when I don't have the time

> programs have a line or two somewhere on the screen that doesn't scroll.
> Usually these are status displays to show useful information (baud rate,
> system connected to, various toggles, etc..).

Of course, you can do all that (and more) with GEM, but GEM is difficult
and slow. The fast way is to use Line A.

> I've searched my wonderful MWC manual, but there's no mention on how
> to create something to this effect.

To translate the following for MWC, you'll need to look at the linea.h
file in your \include\ directory. It's coded for Sozobon C and Sozobon
assembler.

```
=cut here============================
* LINEA.S -- assemble this function with jas.ttp; don't optimize it
.text
.globl _getlinea
_getlinea:
.dc.w $a000
rts

=cut here============================

/*
* STATBAR.C
* cc -O -DTEST statbar.c linea.o
*/

#include <stdio.h>

#define XP -28 /* where the current cursor X value is stored */
#define YP -26 /* where the current cursor Y value is stored */

#define LINES -42 /* where screen's size in lines is stored */
#define COLS -44 /* where screen's size in columns is stored */

#define IP(x) ((int*)(linea+(x))) /* isn't C a pretty sight? */

static long linea;
extern long getlinea();
```

```
lkbar()
{
linea = getlinea();
(*IP(LINES))--;
}

unlkbar()
{
(*IP(LINES))++;
}

clrbar()
{
statmsg("\033K",0);
}

statmsg(msg, x)
char *msg;
int x;
{
int xp, yp;

xp = *IP(XP); /* Save cursor's row */
yp = *IP(YP); /* and column */

unlkbar(); /* unlock the status bar */
printf("\033Y%c%c%s\033Y%c%c",
32 + *IP(LINES), /* Go to the bottom line */
32+x, /* and column x */
msg, /* write the message */
32+yp, /* go back to where */
32+xp); /* we came from */
lkbar(); /* lock the status bar */
}

#ifdef TEST
/*
* A little demo of the status bar
*/
main()
{
int i;
printf("\033E"); /* clear screen, home cursor */
printf("This is a demonstration of a status bar\n");

lkbar();
clrbar();
/*
* note that you should not end a status msg with a newline!
*/
statmsg("\033pThis is printed on the status line\033q",3);
for (i=1; i<101; i++)
{
```

```
printf("This is line number %d\n", i);
}
clrbar();
statmsg("\033pPress any key to exit\033q",3);
getch();
unlkbar();
}
#endif

I just tried ftp'ing space_ace and I couldn't "get" it. Seems that
read permission is not set for 'the world' (not the owner or group).

Could someone at xanth.cs.odu.edu fix this please.

>copy or do I have to buy G+Plus?
>
>:- John
>

I've seen a number of these requests and replies, but it seems that no one has yet pointed otu the difficulty involved with GDOS clones. In order to _use_ GDOS for anything other than screen fonts, you will need device drivers and fonts. The device drivers are not public domain, and are not provided with G+Plus. (I don't know if AMCGDOS has GDOS driver clones or not, but I would _guess_ that it doesn't.) If you just want to draw fonts on the screen, you just need GDOS or a clone and fonts, otehrwise, you'll still have to buy a commercial product in order to get any use from it (just to get drivers).

If you knew this already (as many of you undoubtably did), sorry for repeating it.

2413. Flaky 1040st

Newsgroup: comp.sys.atari.st
Date: 1990-03-07 22:18:58 UTC
From: cantwell@VUSE.VANDERBILT.EDU
Message-ID: <9003072218.AA03079@vuse.vanderbilt.edu>
Source record: 242757

Help! My 3 year old 1040ST seems to be getting a bit flaky lately. I get frequent bombs when trying to run software that used to be fine. Mostly I get three bombs (address error), or two bombs (bus error), and an occasional TOS error #35. I am also getting messages that the disks are unreadable or may be damaged, but after several tries, or rebooting they work fine. I am using commercial and public domain software that has not been any problem in the past, such as Starglider, WordPerfect, ABCD, Daleks, etc. These reside on different floppy disks. I just have the one doublesided floppy drive (no hard drive), and I have never performed any maintenance on it. Could I simply have a dirty disk mechanism or do I have more serious troubles? If so, is there a drive cleaning kit available for the ST? I have also considered the problem of heat, but leaving the machine off all night and trying programs in the morning does not help at all.

By the way, I did recently detect an unidentified virus with ST Virus Killer version 2.01 from George Woodside, and promptly killed it and disinfected all my disks. The effect of the virus was to erase a disk. I lost one disk, and then temporarily lost but recovered another. They all are clean (virus-free) now, according to the program.

From: asqb-sep-a@HUACHUCA-EMH2.ARMY.MIL
Message-ID: <9003080821.AA28087@ucbvax.Berkeley.EDU>
Source record: 242758

I'm looking for a PD (or otherwise) disk editor. I had dl'd dvist.uue from our Sperry 5000/85 to my ST and unarced it. Unfortunately, I wasn't paying clos e enough attention when I got an out of disk space before arc had finished dearcing and I hit <delete> instead of cancel. Ouch!

To make matters worse, while trying to recover the file with Disk Doctor (original 85/86 -- who knows if they ever had a newer version) I quit in mid-stream because I thought the data in the sectors was starting to look a little strange. Wrong move. I now have half the file back -- I guess that is better than nothing except I've already dearced past that.

Back when I was using my Radio Shack Color Computer with OS-9, there was a great disk editor that let you read sectors into a buffer and then write them out to another disk to recover as much of a file as you could -- really nice.

Anything like that out here?

I know where all the sectors are but how the FAT table points to the next cluster and how to change that is still beyond me after reading the docs in DD. (Well I guess not how it points to it, I understood that but rather how to make it human readable and then make the changes).

I've looked at DLII to see if that will help but if it can do what I need it isn't apparent.

You left out two really major questions:
1) How much is Atari going to sell them for? (Exact price, none of this 'less than xxxx computer system'..)
2) Where can users find the TT (or when will dealers get them)?

I just went to the ftp directories and, sure enough, the
permissions were set so that the file was not world readable. I don't
know if there was a reason behind this, so I'm going to forward your
letter to the person that handles the atari section and let him
handle it from there.

Source record: 242770

If anybody can help, I would appreciate it! I'm running into so many
problems on what should be a simplistic matter, I can't believe it!
1) I used DLII and screwed up a partition of my hard drive
2) I zeroed the partition, and eventually reformatted the drive in
order to restore it from backup.
3) The problem seems to be that when I transfer 172K or larger
programs, The drive freezes with busy light on and system says
drive is not on or not plugged in properly etc.
4) Have tried starting everything from scratch, and now cannot even
get drive C on the desktop (yes, I made sure it was capital "C").
For some reason, when I save the dektop with drive "C", the drive
disappears. I checked the Desktop.inf file, and drive C is there.
(Drive D does show up though) Even when I boot using this
Desktop.inf file, Drice C: doesn't show up?
I'm using a Supra 20Meg with a Rodine? controller. Anyways, I really do
need help on this, cause none of it makes sense and I'm beginning to
think maybe the controller is going? Its the only thing I can think of?

>system connected to, various toggles, etc..).

If you want to do this in a totally general fashion (i.e. do more than
just keep N lines at the bottom of the screen from scrolling) you need
to use the vdi functions to write on the screen, and use blitting
operations to scroll sections of the screen. This is a lot more
complex than getting to treat the screen as an almost-dumb terminal,
but sometimes it's worth it.

If you want to make this go very fast, you should be sure you avoid
clipping, blit to byte boundaries, and use a software accellerator
such as TurboST or Quick ST.

> I've searched my wonderful MWC manual, but there's no mention on how
>to create something to this effect.

The stuff I talked about above is in your MWC manual. It's not the
easiest way to do it, but it's the most general one.

I hate to be accused of crying wolf, but this *does* seem to confirm what I heard last week. (I never posted it because I didn't want to be guilty of starting a 'It's coming!' rumor.)

Anyway, I was told by a dealer on Feb 28th that the TT will be released by the end of March. I looked at him incredulously, and he laughed and said that he heard this from both his Atari shipper and by someone he knew at the FCC. Just for completeness sake: the FCC guy told him that the STacy and the TT were both "on the bench" in one of the labs and were due to complete their certification in a few days.

Now...if all this turns out to be another Atari false alarm, don't shoot me I'm only the piano player!

> Hopefully I won't have to write custom screen i/o routines to do

No you wont have to! there is an advertised lineA variable (V_CEL_MY)
just to do this: the short (16 bit) at offset -0x2a (-42 decimal) bytes from
the lineA base can be set to a number N to get effectively a N+1 line
scrolling region vt52. For instance if you want the N'th line to
be a status line, and have a (N-1)x80 vt52, you would set

```
char *linea_base = (base of lineA from linea0 (0xA000));

short *V_CEL_MY = (short *)(linea_base - 42L);
short save;
save = *V_CEL_MY;
*V_CEL_MY = save - 1;

....
and before terminating:
*V_CEL_MY = save;
```

its probably not a good idea to assume that the screen is 25 lines
high (or even 80 wide (with can be determined from V_CEL_MX at offset -44)).

To write to the bottom line(s):
- you can use something like v_gtext()
- or you can change *V_CEL_Y, write to the line using
Bcon/Ccon traps, and change *V_CEL_Y back, and so on..

Some of this stuff is documented in <line.h> that i posted here a while
back, or in the more current version of that file that comes with the
Gnu C library (available via FTP from dsrgsun.ces.crwu.edu).

2434. Question!

Newsgroup: comp.sys.atari.st
Date: 1990-03-08 07:17:31 UTC
From: ignac@electro.UUCP
Message-ID: <1478@electro.UUCP>
Source record: 242778

hmmm. i seem to have created yet another controversy over trying to post the Quick ST II demo code to comp.binaries.atari.st. Soooo, i want to get some feedback from net people on a couple of things:

1 - Branch Always Software *ALWAYS* will post a demo of our latest stuff on ALL online services (Compuserve, BIX, GEnie) and we feel (or at least I do) that people on Usenet who don't have access to the above online services (ie: most Europeans) benifit from having the demos posted to comp.binaries.atari.st as well

2 - we will NOT make a special demo version just for Usenet. One is plenty to worry about for later bug reports, etc. we just simply do not have the time to do things specially for Usenet.

3 - because they are demos of commercial products, we put as must notice into the demo to give people ABSOLUTELY no doubt that the stuff is not shareware and is indeed commercial. We feel that this is hardly any different than large shareware notices. And let's face it folks, Branch Always Software is HARDLY on the scale of Apple or Microsoft or even lowly Atari for that matter when it comes to commercial sales. Shareware simply became too large to keep under the table, so going commercial makes our stuff that much more legitimate, (and keeps us out of trouble with government auditors, etc :-) (this point is equally valid for small companies such as Double Click, etc in the Atari world) (and this way, the author of Turbo ST can't yell at us for being "unfair competition" as he said when we were shareware.)

so, the questions i ask are:

Do you Usenet folks feel that the posting of our demos of our products here is a worthwhile endevour, or should we stop?

Are Usenet folks REALLY care all that much if a commercial endorsement is made in the demo??

if the responses are in favour of absolutely no commercial stuff on Usenet, then i guess there's no point but to leave Usenet out on future postings of demos, etc. And i think that in such a small userbase, that would be a damn shame!

(and hell, why should Compuserve, GEnie and BIX get all the good stuff anyways?????)

comments/responses/flames/praise/beratings/humble opinions/blathering/etc accepted free of charge!

>programs have a line or two somewhere on the screen that doesn't scroll.
>Usually these are status displays to show useful information (baud rate,
>system connected to, various toggles, etc..).

Well I've never needed to do this but if I did I'd go about it like this.

Example: Say I want a status line at the bottom of the screen but I want the
other 24 line to scroll about like normal.

Allocate a 256 byte alligned chunk of screen RAM that is 26 lines high.
(26 * 0x500 + allignment)
Use Setscreen (XBIOS #5) to set the logical screen RAM pointer to the start
of this RAM but set the physical pointer 0x500 bytes further on. This makes
the screen output and scrolling not affect the last visible line on the screen.
When you want to change the status line set the logical screen base to match
the physical one position the cursor on the last line and do your stuff.
Restore the logical screen pointer then rinse and repeat ...

Similar nonsense can be performend for upper syslines.

Hope this helps. Enjoy the bombs :-)

I do blame them!
It's people making assumptions that have given the ST a bad name so far.
Look at all the software that breaks on TOS 1.4 and 1.6 because of
'assumptions'. Unless Atari say so officially then nothing is guaranteed.

If your STE has SIMMs, congratulations. If not, too bad, that's the luck of
the draw. Does anyone think it unreasonable to ask a dealer to supply an STE
that definately has SIMMs an not SIPs? I can't imagine many dealers opening
them up for you to have a look. If SIP machines don't sell then Atari might
change their policy but few buyers would ever be aware of the difference.

>'feature' of the machine (rather like the square 68000 being a 'feature')?

I'd second the notion that 'easy upgradability' would be well worth
preserving. I think that's probably even proven by the success of
3rd-party memory upgrades for the ST's (and Megas?).

However, more to the point, from today's Popular Computing Weekly (a UK
'home computing' rag -- issue 402, Mar 8-14): 'The 499 (pound) STE is
seen by Atari UK boss Bob Gleadow as a more professional machine, with
its SIMM sockets for memory upgrades, ...'. This statement is farily
typical of local press reports, and it appears to carry a strong
implication that Atari UK have 'announced' the SIMM sockets as a
feature (which might, of course, be incorrect).

Looks to me like either (a) Atari HQ had better have some words with
its international subsidiaries; or (b) the international subsidiaries
better have some strong words with their local computer journalists; or
(c) UK (at least) STEs had better have SIMM sockets. I'd prefer option
(c). In a 500 pound (about 800 dollar) machine, your profit margin
would certainly not be greatly harmed by spending 50 cents on a couple
of extra SIMM sockets. Would probably be more than offset by eliminating
phone calls and letters to Atari(UK) asking where they are.

(As an aside, I'm not sure where that price came from. From the ads,
it looks like that probably would get you a 1040 STE + mono monitor, or
a 1040 STE + 'business software pack' + 1/2 the monitor. But then,
no-one actuallys sells anything at the recommended price any more.)

From: steven@cwi.nl
Message-ID: <8876@boring.cwi.nl>
Source record: 242785

Is there anyone who has got the SCAT/Silver Reed scanner who wants to exchange information and/or software? In particular, I'm interested in the format of the files it generates, above all *.pr files. These seem to be run-length encoded, but not entirely. Anybody know?

It's a nice cheap scanner, but the documentation stinks! (No technical details whatsoever). I'm not wild about the software either, but once I can convert the files to another format, I don't care.

Thanks in advance. (The above are personal opinions.)

2442. graf_mkstate

Newsgroup: comp.sys.atari.st
Date: 1990-03-08 14:46:44 UTC
From: roland@tuvie
Message-ID: <1160@tuvie>
Source record: 242786

A simple timing loop with graf_mkstate gives about 2500 microseconds
per call. The Turbo-C program is appended to the end of this message.
I use TOS 1.4 and the same result is obtained with Pascal.

However it takes at least 0.1 seconds before graf_mkstate recognizes
any button state change. So we have at least 40 calls to this
AES routine before the change is detected.

I cannot imagine any reason for this.
If anybody knows, please give an explanation.

I tried to send you the following e-mail but it bounced so I am
posting it here.

Sorry I have taken so long to reply, but things have been busy lately.

You were correct that terminator only had the Atari side of uw, and
not the Unix side. I took a second look at the stuff I've got and
I also only have the Atari side. (I will correct this as soon as I
find the Unix side, so if you find it before I do, please let me know.)

The readme file for the Atari stuff said that the author and contact
person was:
John D. Bruner
ARPANET/MILNET: jdb@sl-c.ARPA
UUCP: {seismo,ut-sally,dual,lll-crg}!mordor!jdb
I don't know if that is for the Unix end but if nothing else he
might know where the sources are.

I'm pretty sure the sources are somewhere here at Waterloo (they
tend to keep these things around so they can install the same stuff
on all the Unix machines) so I'll look around here and let you
know if I find them.

I'm trying to write some arcade-quality graphics and sound routines on my ST. Are there any GOOD books that talk about how to do this? I mean, how do people write things like Dungeon Master if there is no information on how to do this?

What I'd really like is "Mapping the Atari, REvised and Updated for the ST!"

Anybody know of any books that talk about this that are available in the U.S.?

I dont CARE what language I need to use it. I'll buy a new language if I need to.

> time it happens but I never exactly identified the problem before. I have
> then two questions:

Well, something is failing.
First choice is that the disk read wrong, and did not report the error.
If you have a standard SH204, this is true. There is a PLA fix from
Berkeley Microsystems (USA) for this.

Second choice on the hard disk is that it read wrong, but the checksum was
OK. Not all that likely, but just as fatal.

Third choice is an unfortunate memory failure. This may be detectable with
a memory check program; but the ultimate test of memory is using it.

Least likely is the file selector. It really cannot direct disk data to
random locations.

> Is it that you cannot have folders nested more than 40 deep, or that
> a program (or process) cannot visit more than 40 folders??
>
TOS in ROMS (1.1 and 1.2) the 40-folder bug is caused from not cleaning
up after VISITING 40 folders. It really screws up after that.

TOS in EPROMS (1.4 aka 1.6) the 40-folder is a LIMIT on depth. You get
a clean error message if you use up your folders.

The fix for both is foldrnnn.prg from atari that adds nnn folders to the
pool.

p.s. the "40" comes from the floppy based systems. TOS 1.1 etc disk
drivers usually added "100" more just to give you a fighting chance.
So on a hard disk it was usually a 140 folder bug. TOS 1.4 does not
have AHDI add the folders as it not necessary to boot successfully.

Surely there must be some OS call you can do to get this information... You
should NEVER hard-code in specific pixel counts, if you do, your software
will not work with any kind of non-standard screen or "overscan mod" or
etc...

>The woman said to me, "Does Atari make that? I thought they went out
>of businesss!" To which I replied, "No, they're still around."

Amazing! Just last month I was reading that the Lynx was still a year away from marketing. This was in a February issue of a video games magazine. So apparently the publishers aren't even aware of what Atari is doing. I was surprised myself as I read this article, to read that someone was actually using a Lynx. When did it get on the market? How much does it cost? How many games are available?

I sure hope an embarassed Atari Advertising Manager gets a hold of this (are they trying to keep Lynx a secret like the A-bomb in WWII).

Source record: 242798

When I was up in Phoenix yesterday for an Intel seminar (no boos and hisses - it was for work), I stopped by Computer Works and picked up the Feb 90 issue of ST WORLD (UK). (Nice article Mathew)

There on the inside back cover was the answer to my question about disk utils which can grab sectors and write them to another file. The name of the program from HiSoft is KnifeST. Has anyone from across the pond used this yet -- Mathew?

I would expect that Michtron would carry this along with Lattice C5, anyone have any info on this?

>
>I do blame them!

Well I don't!!!!! If Atari gave some magazine a machine to be reviewed, I think it reasonable to expect them to also include a description of the machine, including what are and are not features. Otherwise, all they would be able to publish is a picture of the machine! (Not even that, because then they would be "assuming" that Atari won't change the look of the machine)

>It's people making assumptions that have given the ST a bad name so far.

No, it's (say it with me, now...) INEPT MARKETING AND MANAGEMENT AT ATARI that has given the ST (and the rest of the product line) a bad name. Does anyone REALLY think that charging people $200 - $300 for documentation and then forcing them to sign a non-discosure agreement for contents therin is a good idea? I sure as hell don't! I realize that you get more than the docs for the money, but my point is if you want any documentation, you have no choice but fork it over.

>Look at all the software that breaks on TOS 1.4 and 1.6 because of
>'assumptions'. Unless Atari say so officially then nothing is guaranteed.

TOS itself has bugs, does this mean Atari made 'assumptions'? And since when does Atari say anything "officially"? The reason people have to 'assume' is that Atari is mute.

>
>If your STE has SIMMs, congratulations. If not, too bad, that's the luck of

>change their policy but few buyers would ever be aware of the difference.

Well, I know that if I was an Atari Service Center, I'd be pretty pissed off at having to deal with lots of little variations of a machine because Atari found it could save $0.68 by changing something... How much does Atari spend re-designing parts of their boards so they can save a couple of cents on parts? No wonder nobody takes them seriously! Get your act together, Atari!

>I'm trying to write some arcade-quality graphics and sound routines on my ST.
>Are there any GOOD books that talk about how to do this? I mean, how do people
>write things like Dungeon Master if there is no information on how to do this?
>

I don't want to sound negative, but NO, they're aren't any good books
about this written specifically for the Atari. The folks who write games
professionally have (I would guess in general) lots of experience with
other machines that are well-documented, so they know what kinds of
techniques to use. Much of the info on the nitty-gritty details about
the ST is posted here and on the online services (e.g., GEnie), so keep
reading.

>What I'd really like is "Mapping the Atari, REvised and Updated for the ST!"

That wouldn't be very useful, and even if it existed Allan Pratt would
(I bet) personally hunt down all the copies and burn them. Unlike
programming 8bit machines, you can't just poke all around an ST.
Applications have to be well-behaved; i.e., they can't whomp all over
memory, the Bios, etc.

Most importantly, the OS in the ST changes from time to time, and
undocumented "poke" locations change. You don't want programs that
rely on fixed locations in the Bios code, since such programs would not
work with all version of TOS.

What would be useful: "De Re ST". Unfortunately, no one's interested
enough or willing to write a book like "De Re Atari" for the ST.

>...
>I dont CARE what language I need to use it. I'll buy a new language if I need
>to.
>

Well, if you really want to write professional quality routines, you
will have no choice but to use assembly language. Nothing else is up
to snuff.

Your reply is rather arrogant since your supposed to be representing
the company we are responsible for keeping in business.

What you should have said was don't buy any Atari product expecting
to be able to upgrade it unless you want to kludge it and work with
little or no support from Atari.

OK, I take your point Neil but I still think some sort of statement from
Atari about what exactly the new features of the STE were would have
helped. If there was such a statement then fair enough, it is totally
the fault of the magazines and I certainly agree that they are always
the first to spread stuff about.

However, Atari should know by now that people 'assume' everything where they
have little information, that goes for TOS as well as the STE in general.

Anyway, the damage is done, if Atari doesn't change it's policy in the
light of assumptions made about the STE then further damage will follow.
Everyone has believed what they have read about the STE, dealers who
advertise the STE as having upgradable memory and companies who have
started advertising SIMM plug-ins for the STE will be made to look fools
when SIPP STEs appear. This *can't* do Atari any good but it can severly
damage the reputation of the STE.

The STE is a great machine but it has been bashed about by the magazines
for a few months now, any further damage may be difficult to recover
from.

I'll shut up now,
Mark.

Documentation? Wots that then?

2461. Programmers, back up your code!

I would just like to pass on an experience that I had about 5 mins ago. If you are a programmer back-up your source code! I was writing an alternate desktop (ie. like NeoDesk). I have spent about 9 months on it. This little gem (ha,ha) had everything! Write verify toggle,repair disk, own item selector,8 windows,all drive support,twisted format,extended format, load program into memory and switch between them,neat little icons,colors!, timer,auto screen off,seek time set,and many more! I had also written some assembly programs to go with it (ie. utilitys!).. Well, I just got finished with it and compiled it. Ok, I test it out, all works great! I'm soooooooo happy,run the resource editor (change a few things),save the new .rsc file, load up the editor to edit the code a little for looks,i get TRASH!,bang on keyboard,doesn't help.. All programs on disk are screwed! Do you think i'm gonna do it all over? Hell no! So the moral of this story is "If you have a big project, back-up you code!!!"..
THE END

2462. PC SPEED and CONFIG.SYS

Newsgroup: comp.sys.atari.st
Date: 1990-03-09 00:24:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <90Mar8.192623est.58347@ugw.utcs.utoronto.ca>
Source record: 242706

My latest tests of PC Speed have been with DOS 4.01. When I put the following in my config.sys file:

STACKS=32,128 (thanks to Michtron for the advice)

most of the problems I have had with stack overflows have disappeared. However, PC GEM continues to be a problem. After a short usage, or even on start up, PC Speed hangs.

I do not have any intention of using PC GEM but I feel that emulation should be as close to 100% reliable so until I get PC Speed workin with GEM I'll consider the product unstable.

Feedback from other PC Speed users would be helpful (anyone out there willing to report on SuperCharger?)

2463. PORTFOLIO Development Kit

Newsgroup: comp.sys.atari.st
Date: 1990-03-09 00:30:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <90Mar8.193322est.58367@ugw.utcs.utoronto.ca>
Source record: 242707

Through discussions with Atari Canada, I learned that there is a Portfolio development kit that consists of an emulation program that lets you program on a standard PC as if it was a Portfolio. Once the code is tested, it is then transferred to the Portfolio.

One hitch. You have to be a registered developer to get the product. That's a shame because the Atari world is famous for its PD and Shareware goodies that are discouraged by limited availability of a development environment.

While I understand that DIP has the rights to the documentation and such, it seems to be self-defeating for a manufacturer to limit distribution of info that will promote the writing of software for its computer!

In addition, why doesn't Atari issue a file transfer code for the ST to allow ST-Portfolio dialog via the smart parallel interface like it does with the Atari PCs?

I think I read in Popular Computing Weekly that 100,000 (!) Lynxes were
sold in the USA during the Christmas rush, leaving all sources dry.
Atari were careful not to advertise too much, as they knew that they
could not keep up with the demand, and that would just damage their
image...

Now, this is what I *seem* to remember, and it may all be utter rubbish.

Popular Computing Weekly, btw, is an English magazine.

> the ganging of a 9 pin gender changer and 9 to 15 pin adapter to get
> the NEC 3D to talk to the video box I have. Even without that problem the
> Multisync is not as sharp as a true monochrome monitor.

The problem is you're using the NEC's "monochrome" mode, not the
NEC's color mode. I've been using NEC in monochrome for a half a year,
and it's *sharper* than the true monochrome. Call up NEC and ask them
for a pinout of the 15-pin adaptor. I don't recall offhand what my
pinout is, and I'm in the lab right now, so I can't look, but what you
can do is buy the Practical Solutions "multisync" cable and go from there.
There is an article in terminator about how to go about connecting it;
this is for the Multisync 2 but the idea behind it works with the 3D as
well.
If all else fails, call NEC and tell them your situation. I
ended up getting it right by playing around with it, and the cable is
a real mess, all the wires are the same color, and I don't want to pull
it out and check to see which pin goes to which until I have to. I
admit, it's not the easiest thing in the world to do, but it did save
me from having to use two monitors.

PS: Using the 9-pin gender changer ganged to the 9-to-15 pin adaptor
probably IS the problem. If switching the "color" switch on the front
panel causes your screen to change, then it isn't attatched correctly.
The same goes if your characters blur into each other.

----------<cut here>----------

Date: 21 Feb 89 03:02:45 GMT
From: tektronix!ozvax!tekcsc!jeff@ucbvax.Berkeley.EDU (Jeff Beadles)
Subject: Here's how to hook a MicroSoft Mouse to a ST
To: info-atari16@score.stanford.edu

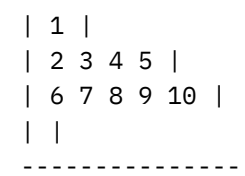
Well, here is how to connect a Microsoft Mouse to an Atari ST. (520/1040)
The Atari has a 9-pin D-type connector. The Microsoft Mouse has a rather
strange connector on the end. To prevent having to cut the mouse cable up,
I made this adaptor. If you still can't follow it, please let me know and
I'll try to redescribe it. This does work for me. I've been using it for
6 or so months now with no problems at all. It does take some soldering
skills, so if you're not so hot at soldering, find a friend to help.

As far as I know, this does not effect your Atari's warranty. However, I
have not asked Atari. :-)

Atari ST	Microsoft Mouse ST	expected signal
1	5	XB
2	3	XA
3	8	YA
4	9	YB
5	N/C	N/C
6	2	Left button
7	N/C	+5VDC (N/C)
8*	6	and also tie to pin 1 Ground
9	7	Right button

* = I am not sure why I have pins 6 & 1 tied together, but it does work.

The Microsoft mouse connector looks like this. This is the solder side,
with the leads pointing up.



If you can not use the connector, the pins are numbered as follows. This
is the connector side from the Microsoft Mouse plug:

```
/------------\ This is a view at the front of the connector.
/ Blank "KEY" \ It is where the plug from the mouse would be.
/----------------\ The pin labeled 'n' is not connected.
| n 4 X 8 | The place labeled 'X' is filled, and does not
| 9 7 1 2 | have a pin.
| 5 6 |
\ /
\------------/
```

Have fun!

Jeff

I just found this on genie.

Category 19, Topic 2
Message 122 Wed Mar 07, 1990
AVANTGARDE at 17:23 EST

To all pc-ditto II owners

If you are waiting for the replacement PAL chips, we began shipping them Wednesday, March 7 and Thursday, March 8. We recevied PALs on Monday, but they were blank. We were able to pressure the distributor to send correctly programmend PALs, and they came thru Wednesday afternoon.

Thanks for your patience and support! Its been a long time, but I think you will find it worth it!

Bill Teal

I'd have to question that he started shipping them on Thursday when he posted this on Wednesday. But, he's been working hard.

> There is only one Fortran compiler for the ST that I know of, Prospero
> Fortran. To my understanding, it is excellent, but also "big bucks."

There is also Absoft Fortran, which I believe the company is no longer
actively working on upgrades for (?), and a German 68000-based fortran
compiler which I got a doc for a long time ago but never had any luck
contacting the author to get a recent version of. It came out of CERN
or some similar physics-type envionment, and didn't look robust enough
to compile my typical zillion-line programs.

Absoft is the company that wrote Mac Fortran for Microsoft. They're
also a bunch of physicists :-)

Marcus Bointon asks about sources and data for the 6581 SID chip...

One source is a company called JAMECO in the USA... they list most of the Commodore-64 chips, including the SID ($12.95 US).

Their order number is (415) 592-8097 (they're in the Pacific Time Zone)

They may also be able to supply specifications on the 6581.

shell0 clears shell_p (don't you have shell0.c). In GEMINI 1.1 this isn't
really necessary, because shell_p is reset on reset.

>
> Overall, GEMINI has just about everything I've been wishing for in a graphic

Dear Imran Anwar,
RE: ST+ LaserJet IIP + Spectre .....
I have sent a long reply to you message on the RE: topic directly to your Address sometime back but my reply bounced and I have no time to retype it again. How ever this may benefit other netter too.
I have been using the LaserJet IIP since December'89 with MEGA4. I also use it with Spectre GCR with MacPrint and Adobe Type Manager. Regarding the fonts that you ask. MacPrint comes with several SoftLJ fonts which allow you to load only 2 Fonts into memory at a time. You should replace Apple BitMap fonts with MacPrint Screen fonts in order to get correct spacing and format. ATM comes with few Adobe outline fonts but you can buy extra fonts from them. Again it is advisable to change the apple bitmap (Screen fonts) with Adobe screen fonts for the same reason as mentioned before. You can get Adobe Screen Fonts but not the Outline fonts from Mac-Archive@RICEVM1. Under IBM emulation I tested my IIP with Wordstar 4 it print out with the printer internal font which can be selec-ted with MENU button. Postscript can be printed out (with long waiting time) using Go Script, a postscript software emulation from Laser Go. I used PC-Ditto (Disk version) to run IBM programs at that time. Now I got my SuperCharger only 3 days ago but still busy testing it with AutoCad Released 10 and MicroStation. Both are running very fast with 8087 co-processor. In fact it is even faster than running with IBM-PC AT with 80287 Co-pro. However, these is beyond the scope that you ask. I will report to the net when I have spent enough time with my new SuperCharger. Please e-mail direct to me if you need more information.
I have order JetLink which said to be faster than MacPrint but have not yet received it. For Atari Program I write my own driver for WordWritter 2 and use TURBOJET for the GDOS based programs (Times Work DTP, Word Up, etc.)

2475. PD/shareware Fortran compiler for Atari ST

Newsgroup: comp.sys.atari.st
Date: 1990-03-09 08:39:00 UTC
From: Ritzert@DMZRZU71.BITNET
Message-ID: <900309083947.691399@DMZRZU71-UNI-MAINZ--GERMANY>
Source record: 242719

I will start porting f2c as soon as my gcc1.37 is complete (which will take 1-2 weeks due to the speed of bitftp). f2c converts Fortran code to its C equivalent. Its based on the "real" *nix f77. Compiling the resulting c-code with pcc-based c-compilers leads to nearly identical executables as the f77-compiled original. f2c is free software.

stuff deleted...

>Do you Usenet folks feel that the posting of our demos of our products here
>is a worthwhile endevour, or should we stop?
>...

I would appreciate demos for commercial programs on usenet as long as
the functionality of the demo is not restricted too much. In my oppinion
this is the case with the quickst-demo. And don't forget, there are
other commercial demos around for quite a long time which are much more
restricted (jil2 as an example).

Please don't forget --- shareware is just another way to distribute
commercial software. So, if You tolerate shareware demos You should
tolerate *functional* "commercial" demos, too.

> I've searched my wonderful MWC manual, but there's no mention on how
> to create something to this effect. If I had $250 to plunk down for
> developer docs, I'd do that. If Atari was more leniant with disclosure

The docs wouldn't help you, because the trick is very simple.
1: Compute how meny bytes there are in the region you want to keep fixed
(like two lines in monochrome = 80*16*2 bytes)
2: Ask via the XBIOS for the Logbase pointer. Keep it for later.
3: Subtract the computed amount
4: Set the new Logbase via the XBIOS
5: Insert and delete lines to your hearts content, but never put the
cursor in the top lines (the two lines of the example don't really
exist. Don't use a clear screen or any other code that would affect
the non existing lines.
6: After scrolling, put the Logbase back to its old value.

If you start with asking for the resolution you can make this fully
portable.
If you want this to work also for non standard fonts you have to determine
the font height first. This height can be found at the negative Line-A
variables. They are described in a book by Katherine Peel (in one of the
appendices). Alternative way of finding: play around with some standard
fonts and a debugger. The bytes with a negative offset of at most 46
from what dc.w $A000 returns in a0 have been fixed by Atari.
(it is amazing how many programs get confused by a 8*12 font. Even GEM
shows a few bugs).

Hello there,
Thanks to all who replied to my earlier postings about
Gdos and printing. However one question which has not been answered is that
regarding opening workstations. I would be eternally grateful if someone could
explain these to me. Am I right in thinking that you can open a virtual
workstation to have any size and that the pixel size can also be altered, ie
is this how a lot of the art programmes achieve zooming, or am I barking up
the wrong tree!
Is there anywhere such information can be found or example
routines obtained.

Many Thanks,
Nick.

Open it up and reseat the socketed chips.
While this applies to the ROMS and Video shifter, it is particularly
important to pull out and reinstall the little square ones in a 4 sided
socket. (MMU to you). It makes only light contact with its fingers and
can cause all kinds of sickness.

BTW this is what the "drop it on the floor" remedies are trying to do, only
its a lot safer to just reseat the chips.

>Now, this is what I *seem* to remember, and it may all be utter rubbish.

The Jan-Feb issue of "Current Notes" (an *excellent* rag put out by
- I believe - a consortium of Atari user groups) has a pretty decent,
realistic article on the Lynx-vs.-GameBoy fiasco. The figure used
in that issue was closer to 70,000 Lynxs sold.

You know, I picked up my first copy of Current Notes a few
months back, not expecting too much because it had that "put out
by a user group" look to it. You know: desktop published, black and
white from cover to cover, etc...

I have to say, it was one of the best researched, best written, most
honest Atari specific magazines I have ever read. Product reviews
were honest - none of this "everything on the Atari is perfect"
attitude...the editorials were realistic - analysis of Atari US's
marketing was right on target...the articles were well researched -
no "well, gosh, we've seen pictures of the TT, so it must be almost done"
stuff...

Hats off to the Current Notes people...

```
**************************************************************************
*
* Would you like to spend a summer doing aritificial intelligence research?
*
If so, then read on bunky, 'cause this is for you.

More seriously, this is a special opportunity for undergraduates to participate
in our second annual Nation Science Foundation "Research Experience for
Undergraduates" at the American University in Washington, D.C.

When: Mid-May 1990 until Mid-July 1990

Why : To learn what "real" research is like.

How much: *YOU* get a $2,000 stipend and FREE room and board on campus
(you must live on campus though, it's not that bad :)

Who can do this : Any undergraduates who are AMERICAN citizens and are
knowledgable in Pascal and Unix. Familiarity with 'C'
is also helpful.

How to apply : Send e-mail to giampal@auvm.bitnet and I'll send you
electronic versions of the application which you can fill
out and mail to us (at the address below).

OR
You can write directly to the head honcho:

Dr. Larry Medsker
Computer Science and Information Systems Dept.
The American University
4400 Massachusetts Ave. NW
Washington, DC 20016

For more info, you can call this number and ask for Dr. Medsker or Dr. Anita
Lasalle.
(202) 885-1470

O.k. now for some more techie info about what you would _really_ be doing.

This "research experience for undergraduate" (REU) project is based on a
grant from the NSF. The focus of the project will be on "intelligent
systems" (including neural nets, expert systems, and communictating agents).
You will be experimenting with software development tools and developing your
own software and intelligent systems. We have several grad students doing
neural net research, so there is a possibility for collaborative work. In
addition, there will be opportunities to publish papers about the research
```

carried out.

I did this last summer, and it was a great deal of fun and I did learn quite a bit about what research is like. You have plenty of opportunites for seeing the Washington D.C. area, and general touristy things (if that's your bag). You meet some really cool people and make good contacts. If you can do this, and are interested, it really is the ticket for a summer job.

I bought one March 3rd here in Chicago, Il, U.S. A very nice machine.
The graphics are very good for the display. It is very crisp.

My dealer did not have any add-on games left. He had apparently assumed
that each purchaser would have different tastes and only get several
add-on games. In fact the first buyers bought one of everything. I
guess I will have to wait for new shipments.

Check it out. They are great fun. (Also great baby-sitters for longer
car trips :-)

>on keyboard,doesn't help.. All programs on disk are screwed! Do you think
>i'm gonna do it all over? Hell no! So the moral of this story is "If you
>have a big project, back-up you code!!!"..

You seriously wrote code for 9 months without backing up any of it? Anyone writing code on the ST (or any computer for that matter) you SHOULD back up your sources VERY frequently. At best once a day (assuming your editing every day) at the worst once a week (same assumption).

Even the VAXes (running VMS) here at work get backed up daily and they are MUCH less error prone than the ST. Of course some may argue that the stuff on the VAXes is much more important than what I have on my ST :-)

So, yes Dana I totaly agree with you..BACK UP YOUR CODE...I'm sorry to here that you had to learn the hard way.

As I recall, regardless of the contents of DESKTOP.INF if GEM doesn't think there is a drive C when the desktop comes up then it will not display the icon. It will however display all the other drive icons whether there is a coresponding drive/partition or not. What you describe usualy happens (at least to me) if the HD driver is not installed at boot time.

In other words boot the system, run the hard disk driver, then install drive C icon and double click on it to see if its working. If you have set your HD to autoboot then the drive C icon should show up when you boot.

Is the drive working at all at this point? That is does it work after you install a drive C icon?

[rationales deleted to save bandwidth]

I support Ignac's posting of the Quick ST II demo. In the past I have brought
software that I didn't need or never used, simply because I didn't have a good
idea of what I was getting, even if the dealer let me try it out and read the
manual. I have installed the demo version and tried it out with many of my
existing programs. This type of tryout is very beneficial, as I found out
firsthand how reliable it is.
I am planning on buying the commercial version as soon as I can find a dealer
near campus who stocks it. I have no unrealistic expectations (Quick ST II demo
left some cursors scattered in Flash, but otherwise it was flawless), and I
know what I'm going to get.
I wish that other companies would follow Ignac's example, as I like getting
free stuff, but more importantly, it allows the customer to make a judgemental
decision, which is important as much of the decisions I make as a software buyercomes from
secondhand information or shop talk.
I don't see demo's overcommercializing Usenet. Although Usenet is a non-profit
entity, it serves to distribute information throughout users, and I believe
commercial developers should have that access to inform the public on new
products, and more importantly, demo's to inform the user of what is available
for his or her machine.

2495. Running MIDI at 500KHz -- conclusions

Newsgroup: comp.sys.atari.st
Date: 1990-03-09 21:56:13 UTC
From: dmb@wam.umd.edu
Message-ID: <1990Mar9.215613.17075@wam.umd.edu>
Source record: 242739

Well, the situation looks pretty bleak. I've gotten the MIDI port to run at 500KHz without hanging the machine, but the connection is too noisy (to say the least). I set things up so that I'd type on one machine and look at the output on the other. Ever set your modem to the wrong baud rate in the middle of a session? Well, that's about what it looks like on the receiving end. Garbage!

I can only assume that the opto-isolators won't handle 500K baud. It doesn't seem like a software problem.

2497. Non-scrolling screen regions

Newsgroup: comp.sys.atari.st
Date: 1990-03-09 23:48:57 UTC
From: S61304@PRIME-A.POLY-SOUTH-WEST.AC.UK
Message-ID: <9003100804.AA03846@ucbvax.Berkeley.EDU>
Source record: 242741

(From "The Masked Rat Fink" "Computing and Informatics Yr4")

In response to all the talk about non-scrolling regions on the ST screen,
I'd just like to ask a question and then try to answer it (!?).

It's just that I remember the book that I have (Abacus, St internals
Volume 3) saying that the screen is a VT52 when using standard output
functions, such as printf (in C). And infact a small application that I
wrote used a reasonable number of VT52 control codes with great success,
however I admit that I didn't try screen regions, although if the screen
is true VT52 then I see no reason why it shouldn't work.

I have a (completish !?) list of VT52 control codes from an official DEC
training course that I don't mind breaking the copyright on :-) if anyone would
like me to type it in.

The VT52 control codes for those that don't know are a standard set of ways
of controlling the screen curser, including such wonders as directional
control, display codes (inverse, bold, flashing etc) and scroll or no scroll
regions.

Perhaps I'm being a bit simplistic, but it seems to me that the above
would quite easily solve the problem of creating a non-scrolling region.

Hope this helps you, and if I receive enough Emails then I'll post to the net.

Nb, VT52 is a trademark of Digital Equipment Corporation

>hcj@lzsc.att.com

Around Christmas time 1989, I posted an inquiry
to the net in regards to actual purchases of
the TT. I was particularly interested in hearing
from the folks from Germany. WHy? well, I had been
flamed on many occasion for expecting ATARI to offer
us the truth. To wit:

The Atari "policy" as it had been stated by a large body
of netters, including those who work for Atari, is that
Atari will not announce a new machine that is not to be
released within the following 90 days. This seems perfectly
reasonable. So in light of this information passed on to me,
i posted an inquiry *** 120 *** days AFTER the Dusseldorf
"announcement" of the TT. I wanted to know if anyone
in Germany or anywhere in Europe was able to purchase a TT
from a dealer.

The response i got PERSONALLY was from an engineer from ATARI.
His statement was on the order of: NO one can have purchased
a TT in Europe... they're not available yet... furthermore,
ATARI has stated quite clearly that the TT will not be available

until the END of the THIRD QUARTER 1990.

It is clear now that "available" has nothing to do with
consumers and dealers.

I am reminded of that James Taylor song: "I was a fool to care..."
ANd that other one: " Let it fall down, let it fall down, let it
all fall down..."

Again, i remind myself, this complaining doesn't do a damn thing.

sorry....

2499. ST-Report / CPU-Report on Usenet?

Newsgroup: comp.sys.atari.st
Date: 1990-03-10 03:59:15 UTC
From: david@bdt.UUCP
Message-ID: <1567@bdt.UUCP>
Source record: 242743

I have been asked to post the following for Michael Arthur. Please
don't reply to me about it. You can reply to MICHAEL_ARTHUR@bdt.UUCP
or post followups here for him to read.
- David Beckemeyer

CPU Newswire/ST Report is a weekly online Magazine which deals withboth
Atari-related news and events, but also with current decisions and happeniNGS
of Atari Corp. itself. It is already very popular on GEnie
Compuserve, BIX, and Delphi, but ST Report is also considering distributing
CPU Newswire via Usenet. Since each issue is an ASCII text file typically
100K - 140K in size, what are the possible implications of distributing ST
Report via this avenue?

Also, since CPU Report (a column in ST Report) is about 12K - 25K in size, and
deals with the microcomputer industry, I believe that I asked you about the
feasibility of also distributing it via Usenet, and the Newsgroups which would
theoretically distribute it.

In order to further discuss the possibility of distributing ST Report or CPU
Report via Newsgroups on Usenet, could you reply to this message, detailing
your thoughts on the feasibility on this idea, and on how it could be
implemented?

Michael Arthur

In article <2873@gos.ukc.ac.uk> David Clear writes:

> I know Gemini doesn't work with TOS versions before 1.2. The question is,
> why? Is there any chance of Gemini ever being released for older TOS versions?

That's because GEMINI uses the BIOS character I/O vectors that were
introduced in TOS 1.2. So there never will be a Gemini for TOS 1.2.
However You CAN use MUPFEL.PRG (the standalone command shell) in conjunction
with VENUS.PRG (the standalone desktop) on TOS 1.0.

2502. Ram expansion on STes

Newsgroup: comp.sys.atari.st
Date: 1990-03-10 08:04:09 UTC
From: DUJARDIN@FRESE51.BITNET
Message-ID: <9003100804.AA03794@ucbvax.Berkeley.EDU>
Source record: 242746

In France (and, I suppose, in Europe too), there is no trouble about expanding
memory on STes. Every Atari retailer offers STes up to 4 MB, and I've seen someone buying a 8 MB machine. Of course, Atari does not make himself the upgrade, and these are in fact 1040 STes. When you ask for more memory, the retailers simply open the 1040 and see if it needs SIMMs or SIPs. BTW, Atari doesn't sell 520 STEs at this moment, because it would be cheaper to buy a 1040-expanded 520 than a true 1040 (as an expanded Mega ST1 is cheaper than a Mega ST2 or ST4). Indeed, memory expansion goes cheaper and cheaper : an 1 MB SIMM now costs here 890 FF (about $ 150), and a 4160 STE is 6990 FF ($ 1100).

RE: PC-SPEED AND CONFIG.SYS
Greg Csullog mentioned in his message on the Ref: subject "Does anyone out there want to report about Supercharger?"

I got my SuperCharger which I order directly from Beta Systems Computer AG, Frankfurt/Main. During waiting for delivery I have been talking and Fax to the their Executive Vice President a few times. He sound to be a very nice guy and speak perfect English. My SuperCharger comes with Software Version 1.21 which resolved the Serial port problem (its assigned serial port as COM2) It manufacture by Siemens, a well establish German Electronics Firm. The workmanship is superb the plastic casing is metal plated inside (a la Macintosh casing) the PC- Board is a lot neater than my MEGA4 mother board. I temporary fitted with 8087 5MHz co-pro as the recommended 8 Mhz chip is out of stock here. Connecting it as a last chain to the Megafile 44. [I have 3 cartriges one each for Atari, MS-Dos (Dos 4.01 is included with SuperCharger), and Macintosh format (which done by directly connecting Syquest to Mac Plus with homemande cable and format -ting with Mac CMS HD Util Version 5.53.] I tested run AutoCAD Released 10, the Intergraph MicroStation at the speed faster than when these 2 programs are running on the 286 machine with 80287 co-pro. There are following problems which I doubt that they could be solved. 1) The Hercules display mode give wrong aspect ratio, the circle displays as eliptical and the AutoCAD side menu is disappeared to the right side of the screen. It require side scrolling with "/" key. 2. MicroStation uses Sentennal Pro hardware lock plugged to parallel port and need signal from pin 10 to activate. The parallel port on Atari has floating pin 10 (NC) therefore althought I have a licensed software it only work in Demo mode which shut itself off after 15 minutes from boot up time. I still could not figured out how to connect pin 10 to Yamaha chip which also function as MIDI as well as parallel controller chip. Any suggestion on this matter will be deeply appreciated. Main reason for getting SuperCharger rather than Pc-Speed is because of it Co-Pro socket as most programs that I intended to use require Co-Processor. The display is in perfect aspect ratio in CGA mode it is very clear too and with monochrome monitor it shown in grey scale.
It come with a heavy transformer the air freight for 3 units cost me DM.225 due to the weight of these transformers. So far I am very happy with the Supercharger and prefer to run AutoCad with it than on the IBM AT. Print out also quite fast but it hard to judge as I also have the TURBO16 installed in my MEGA.
Just load the Go Script, MS-DOS postscript emulator into my hard disk but have not have an opportunity to try out yet. My printer is HP LaserJet IIP with only 512K RAM. WordStar 4 run very fast too. Booting up DOS from the hard disk takes ony few seconds. I will report again if I come across anything worthwhile.

Suthipuntha, School of Architecture, National University of Singapore.

2504. Gemini patch??

Newsgroup: comp.sys.atari.st
Date: 1990-03-10 08:31:13 UTC
From: rome@ucscb.UCSC.EDU
Message-ID: <1765@darkstar.ucsc.edu>
Source record: 242748

I know that the Gemini desktop will not work on older ST's with TOS 1.0 because it requires at least TOS 1.2. My question is just how dependent on TOS 1.2 is it? Is it possible that some sort of patch could be made so that I (and other low-income students like myself) could possibly run this new desktop without having to purchase a new TOS.

>This is hardly a reason to call a program buggy.
>

Actually, there are a few other factors besides seek time and latency when computing access time. These include command overhead, head settling time, and a few other things which escape me at the moment.

In any event, I believe that ICD states in their documentation that RateHD seeks 50 times from sector 0 to 31,999. Then timing is computed and a figure is spat out. So partition size shouldn't play a part in the computing of the average seek figure.

(FYI, RateHD gave my Wren V a 19 ms rating and the manufacturer specs says that it is 18 ms. Coming to within 6% of the manufacturer's specs is pretty good in my book.)

From: t19@nikhefh.nikhef.nl
Message-ID: <802@nikhefh.nikhef.nl>
Source record: 242750

You must mean the 'Real Time Fortran', used among others by UA1 at CERN (the guys who discovered the W, the Z and damn nearly supersymmetry). I have only seen it on a Mac. It is known here as the 'ghost house'. We never managed to get the 'savage' banchmark to run properly - it would not print 2 numbers (1 was OK), but it has many extensions for real time control of equipment.

My 2c worth on the other 2:
Absoft: fast, extensions, very sloppy syntax checking, no GEM interface worth speaking of (but who does GEM in Fortran?), cheap, no support.
Prospero: integrated environment (without 'make' and no way to hook mine in), slow, good debugger, good hooks to GEM, a bit more expensive.

Geert Jan van Oldenborgh (writing big numbercrunching programs on the ST)

2507. Do Graphics Tablets exist for the ST?

Hi!!

A friend of mine is heavily into animation and CAD with his ST.
He is really good, and he has put on some really good demos at
our club. Anyway, there are 2 things that he cannont find readily
around here:

1) Graphics Tablet [that is the right term for it, right?]
- Is there a manufacturer for these or not? If you can
pleasse specify address, phone #, and aproximate price.
- Does anyone have a used one they'd like to unload? Please
let me know.

2) Genlock
- He mentions this term. I don't know what it is or what
he means by this term. Any pointers would be gratefully
received.

Thanks for any advice. Post or email to me please.

2508. Re: SIMMs for the STE

Newsgroup: comp.sys.atari.st
Date: 1990-03-10 16:29:57 UTC
From: qralph@dna.lth.se
Message-ID: <1990Mar10.162957.26323@lth.se>
Source record: 242552

Here it goes again..... Alan Pratt repeats his "don't expect to be able
to upgrade your STE", but refuses to comment on what some German wrote
recently, that there the STEs are advertised as "easily upgrradeable to 4Mb" or similar.
Let's forget the hints that it actually should be rather easily upgradeable to
16Mb. Anyway -
I like the rainbow - this tells he's got a sense of humour, that he works
late evenings and I would probably like to share a beer with him.
BUT - his disclaimer is all wrong! He is 2, possibly 3 persons. Couldn't he
reveal for us netters a way of knowing who he is for the moment, ending with
one, two or three dots maybe? Just as long as no officlal Atarian could under-
stand it. Sometimes he is just himeself talking freely, that is good. Some-
times he is an Atari representant, refuting the disclaimer about Atari Corp.,
like in this case about the SIMMs. And sometimes the part ".. or anyone else"
in the disclaimer is valid, like when he, both publicly and privately scolds
me and others for telling secrets, like about the STE - especially when I
reported the use of the addresses/registers but also clearly mentioned I
had got it from a German magazine and just translated it. He never ever
asked for an excuse for the scolding. The argument that Atari corp has to
suffer if the info is wrong is so infernally stupid so that too has to be
referred to his 3rd personality - when he represents noone.
IN ANY CASE - whatever Atari ST you have, use SIMMs! piggybacking is out.
Even if you upgrade a 520 to an 1040 use it. So much easier to solder wires
to a SIMM holder than piggybacking expensive chips.
Concerning STEs - never buy anything but 520s, then upgrade the memory yourslef.
Someone on the net talked about the net about the 520STE and 1040STE, that the
520 had 2 256x8 while the 1040 had what??? Impossible of course, SIMMs always
come in pairs, 8 bit each. A 1040STE cannot come as 1040x8, it must come as
256x8x4. That is, 4 256x8 SIMMs.
Hmmm, sorry my bad Swenglish. Should i refer to the late G Gamow, of whom it
was said, that he spoke 10 languages atrociously - but everyone understood
him....

>Mega ST2 or ST4). Indeed, memory expansion goes cheaper and cheaper : an 1 MB
>SIMM now costs here 890 FF (about $ 150), and a 4160 STE is 6990 FF ($ 1100
>).

Well, you can get 1mb of 80ns SIMM from the Chip Merchant for about
US$70.

Mr Kolenko is almost too sensitive I think, but maybe that's better nowadays...
What do we all want? Half of us (including me) want to develop software for the Atari, and be able to live on it, the other half want to get it as cheaply as possible to use. It sure is the perfect example of symbiosis.
All advertising adds to the price of the product. So - everyone gains if the advertising is cheap. I have no complaints if the good guys advertise in the Usenet.

Ignac does have a point. If the entire world knew about the 40 folder bug from day one (ok, maybe day two), why didn't you techno-programmo-studs fix the thing in your subsequent 2 releases of TOS?

If a few German hackers can come up with a kickass TOS substitute working in their spare time (GEMINI) while they study for exams, drink beer, and hang out with their girlfriends, why can't Atari's PAID programmers get these KNOWN bugs out after 4 years? This is hilarious.

That is why my ST is sitting on my desk gathering dust and only getting occasional use as a DUMB terminal, rather than doing meaningful work for me.

GRRRRR!

[about why Gemini won't work with TOS < 1.2]
>
>That's because GEMINI uses the BIOS character I/O vectors that were
>introduced in TOS 1.2...

If some code was written to replace TRAP #13 (BIOS) with something that checked for character I/O function numbers and, if found, jumped through these new vectors (the vectors would, of course, initially point to the BIOS routines (or other routines which then called the BIOS)), would this allow GEMINI to work or is there more to it than that?

Also, if this idea is possible, notes on how these new vectors work would be appreciated.

Maybe I'm grossly oversimplifying things...

Dave.

Don't count on it. We have some *BAD* FORTRAN code here that f2c fails on.
If the FORTRAN is nice and clean it may work without any problems.
Expect to hack the converted code to make it work.

From: schultzd@frith.egr.msu.edu
Message-ID: <6851@cps3xx.UUCP>
Source record: 242561

Ok folks, here's the question...

I just bought a used 520ST (I love it!) and get most of my software
from the net! (Usually terminator!) Downloading a 400K file just
to de-arc it so I can read the docs is a pain...

My solution put the arc.ttp program in my Unix machine. If someone
has already translated Atari "arc" to Unix usable, PLEASE let me
know! If not, I would like source code for arc so that my partner &
I can make whatever modifications to allow it to run on Unix...

THis would save me (& probably lots of others) the hours of downloading
files that we can't use. (The best example I have is I downloaded
a 200K program that only works on Mono monitors. Of course, I have
a color AND I had to download before I could read about this!

If this type of program would be useful to anyone OR already exists,
let me know.

Source record: 242562

In article <1567@bdt.UUCP> david@bdt.UUCP (actually Michael Arthur) writes:

>CPU Newswire/ST Report is a weekly online Magazine which deals withboth
>Atari-related news and events, but also with current decisions and happeniNGS
>of Atari Corp. itself. It is already very popular on GEnie
>Compuserve, BIX, and Delphi, but ST Report is also considering distributing
>CPU Newswire via Usenet.

I've been distributing ST Report via email for quite a whle now. I
feel that it would be a very bad idea to post these to the newsgroup
because:

1) it's big. people in the past have complained about that aspect.
2) it contains utterly totally-commercial advertising for the editor's
business. this IS a no-no at many sites which receive Usenet news
messages over the Internet.

I post a message about availability of ST Report here about every 2
months. I'm surprised you hadn't noticed this.

>Also, since CPU Report (a column in ST Report) is about 12K - 25K in size, and
>deals with the microcomputer industry, I believe that I asked you about the
>feasibility of also distributing it via Usenet, and the Newsgroups which would
>theoretically distribute it.

I wouldn't distribute this to anything but a garbage can. It is an
extremely poor quality "column". If you distributed it to the
newsgroups that it theoretically belongs in, you'd be laughed off of
Usenet. That's just my opinion.

> able to upgrade your STE", but refuses to comment on what some German
> wrote recently, that there the STEs are advertised as "easily
> upgrradeable to 4Mb" or similar.

Look, Allan is a software guy. He is not in charge of European STE marketing. He's just telling you what he's seen in California. If your dealer in Germany tells you that your STE can be upgraded with SIMMS and it can't, that's your dealer's statement. If you find out your dealer is wrong, I'd try to get him to give you a STE with SIMMS. Whether or not you get SIMMS or SIPS, it is not Allan's job to figure out things other than bugs in TOS.

Allan's statement means that you shouldn't be surprised when SIP-equipped STE's show up. It means that you know to make sure your dealer promises, maybe in writing, that your STE can take SIMMs. Allan's statement may save you money someday, and all you do is complain about it.

Oh, once again, Allan, even though I never can remember the right way to spell your name ;-), I just wanted to say Thanks! for the technical information you occasionally post about TOS. It's too bad that people attempt to demand official Atari statements from you when you're here on your own time because you like listening to us argue ;-).

Hi world...

perhaps this has been asked before but I really need to know if there
is a formula which returns the 1st day of a given month in a given
year!
(i.e.
-Input: YEAR = 1990
MONTH = 1 (January)

-Output: DAY = ??formula?? = 2 (Monday)
)

I think that Dave Shumacher (the author of DLibs) had found such a formula
and he had talked about it in the net...but unfortunately i missed that dis-
cusion!

So if anyone remembers it (or knows a different one) PLEASE send me E-mail

Thank You!!

2521. Bob Brodie speaks to Fort Worth/Dallas users!!!

Newsgroup: comp.sys.atari.st
Date: 1990-03-11 07:12:40 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <900311.01123891.034431@SFA.CP6>
Source record: 242565

Hello all,

In these days of ST uncertainty, no doubt exaggerated by so
many factors, it is refreshing to hear honesty and truths. Bob
Brodie arrived at a coordinated users' group meeting conducted by three
Texas clubs in the Fort Worth/Dallas area: North Texas Computer Team,
Atari Users of North Texas, and Dallas Area Atari Enthusiasts. Meeting in
an auditorium at the InfoMart complex, he gave an informative
session, demoing everything that the ST had to offer, short of the ATW,
030, and HOTZ box.
I thought that I'd share part of the meeting with you and do admit
that I feel a bit better about my ST investment.
Bob started the meeting saying that "Atari enthusiasts are moving into
cooperate headquarters now." Interpret that as you may. The impression
given is that the spirit is returning to Atari U.S.A. and a lot of ground
breaking. Here are some brief facts given which he said may be quoted:

1. Atari STe's in U.S.A. -- Seriously, any day. This is not the old
REAL SOON NOW phrase either. I expect the STe's to be available
very quickly.

2. Mega STe's (!!) -- There is real serious talk on the Mega platform.
We have talked with developers and are getting ideas. Currently,
we are investigating whether to build Megas with the standard
internal port or an internal VMI port. Most developers have
opted for the VMI. This is exciting and that is about all that I
can say on it. Just stay tuned.'

3. Stacey -- Should be ready by April/May. The unit here at InfoMart
is not the same as what will be in production. In fact, this
Stacey is version #2 [Bob flipped the STacey over and sure 'nuff,
there it was--a numeral '2']. Here are some changes that we are
doing:

a. We are working from the high end STacey (four meg ram/40 meg
hard drive) to the low end, rather than the other way around.

b. There will not be a battery pack. The STacey sucks the life
out of batteries too fast. Instead, we are working with a
third market company that is producing an external bolt-on
pack which gives about four hours of life on the four megged
STacey.

c. Mick Fleetwood of Fleetwood Mac said that this would be no
problem for his use since electricty is available at concerts
and studios (referencing no battery packs).

4. The Lynx -- Available now at Sears. [hmmmmmmmmmmmm] Production is cranking now and it should be available nation-wide for dealers.

5. MIDI-TASKING -- This is the multi-tasker that has been mentioned in the magazine. As far as I know, it will be available during the latter part of summer. The various configurations are being experimented with. It really is quite solid and will be $12.95.

6. The EQUIPMENT EXCHANGE program -- Objections to high costs of exchange are noted but there is a reason. Too many individuals were using the program to exchange older units for newer. 520 STs with the older singled sided drives were being exchanged for units with double sided. The cost was horrific all in all to Atari. The rest of the users are having to suffer for the conduct of a few.

7. Monochrome monitor shortage -- GoldStar was holding back on production. A threat by our part to use JVC resulted in the resumption of production. The problem should ease by the end of the month.

8. STe's and memory chips -- They are all SIMMS chips, no SIPPS in spite of what has been said on UseNet [hmmmmmmmmmmmmmm].

========

I was impressed with Bob and his answers. Perhaps we are getting ready to see a Winter Thaw for this spring.

Neil Forsyth says,
> ...Unless Atari say so officially then nothing is guaranteed.

Do statements by Bob Brodie, Atari Corp's User Group Coordinator count as "official"..?

If so, then Atari has "officially" announced that the STE is easily upgradable by use of SIMM modules.

He showed a 4160STE recently, but said that Atari doesn't plan to make many 4 Meg STEs, since the 1040STE is so easily upgraded.

Seems Atari needs to not only get their act together, but they need to get their representatives together...

Actually, I don't believe that's true. At least, on my 105 meg Conner SCSI drive there are 34 physical sectors per track, with 33 of them available for data. I.e., there's a spare sector on each track, in addition to the spare tracks that all drives have. Not only do you not lose an entire track due to one bad sector, you also avoid a performance hit due to having to seek to a spare track.

I'm not sure if this is the case for all SCSI drives or not. I suppose
it could depend on the particular implementation of the smart controller
imbedded in your SCSI drive. You might want to check to see which way
your individual drive handles it.

Well, something is failing.
First choice is that the disk read wrong, and did not report the error.
If you have a standard SH204, this is true. There is a PLA fix from
Berkeley Microsystems (USA) for this.

Second choice on the hard disk is that it read wrong, but the checksum was
OK. Not all that likely, but just as fatal.

Third choice is an unfortunate memory failure. This may be detectable with
a memory check program; but the ultimate test of memory is using it.

Least likely is the file selector. It really cannot direct disk data to
random locations.

Subject: SIMMs for the STE
Message-ID: <1990Mar10.162957.26323@lth.se>

Here it goes again..... Alan Pratt repeats his "don't expect to be able
to upgrade your STE", but refuses to comment on what some German wrote
recently, that there the STEs are advertised as "easily upgrradeable to 4Mb" or similar.
Let's forget the hints that it actually should be rather easily upgradeable to
16Mb. Anyway -
I like the rainbow - this tells he's got a sense of humour, that he works
late evenings and I would probably like to share a beer with him.
BUT - his disclaimer is all wrong! He is 2, possibly 3 persons. Couldn't he
reveal for us netters a way of knowing who he is for the moment, ending with
one, two or three dots maybe? Just as long as no officlal Atarian could under-
stand it. Sometimes he is just himeself talking freely, that is good. Some-
times he is an Atari representant, refuting the disclaimer about Atari Corp.,
like in this case about the SIMMs. And sometimes the part ".. or anyone else"
in the disclaimer is valid, like when he, both publicly and privately scolds
me and others for telling secrets, like about the STE - especially when I
reported the use of the addresses/registers but also clearly mentioned I
had got it from a German magazine and just translated it. He never ever
asked for an excuse for the scolding. The argument that Atari corp has to
suffer if the info is wrong is so infernally stupid so that too has to be
referred to his 3rd personality - when he represents noone.
IN ANY CASE - whatever Atari ST you have, use SIMMs! piggybacking is out.
Even if you upgrade a 520 to an 1040 use it. So much easier to solder wires
to a SIMM holder than piggybacking expensive chips.
Concerning STEs - never buy anything but 520s, then upgrade the memory yourslef.
Someone on the net talked about the net about the 520STE and 1040STE, that the
520 had 2 256x8 while the 1040 had what??? Impossible of course, SIMMs always
come in pairs, 8 bit each. A 1040STE cannot come as 1040x8, it must come as
256x8x4. That is, 4 256x8 SIMMs.
Hmmm, sorry my bad Swenglish. Should i refer to the late G Gamow, of whom it
was said, that he spoke 10 languages atrociously - but everyone understood
him....

Sounds like you have a hardware problem. (Software should not wear out like this.)
This value of 172K is intriguing. This might be caused by a memory problem, therefore run a memory test program. Also, open your computer and re-seat all socketed chips. This seems to work for many people.

Can you cause your computer to fail by dropping it from 1 inch on a table ? This would indicate bad connectors or sockets.

Of course, the problem could also be in your hard drive. DON'T test it for bad connectors by dropping! (More general: never move a running hard disk drive.) Instead, borrow another ST and try to restore your files with that machine. If it fails in a similar way, your drive, drive controller, drive power supply, or cable is bad.

Well, if you can ftp you can find source for Unix-arc here at Vaasa,
Finland. It is in pc/source and file is called arc.tar.Z

]| Gribnif software. (These are the people that sell NEODESK).
]Whoops, that program is really named SCRDMP24! The brain was a bit fogged
]when I posted this. :-)

Anyway, there are many more programs which allow this. I for example am
using a program called fx_emu.prg which is by NEC.

I hoped TOS 1.4 will overcome this nasty "feature" but it isn't. Sigh.
If Atari used the right Codes, the could have made a hardcopy which works
on both, 9 pin and 24 pin, printers.

Stefan Lindner's TeX-Driver (nl10.ttp) does this. The output isn't too well,
and the pagesizes are distorted, but you can print with it.

Allan, what about including 24 pin support in the next release of TOS?
It can't be that much work and it is well worth it (IMHO)...

> has already translated Atari "arc" to Unix usable, PLEASE let me
> know! If not, I would like source code for arc so that my partner &
> I can make whatever modifications to allow it to run on Unix...

Well, I recently pulled arc off the sources archive here at Imperial
College to compile it on a Sun4. The distribution seems to be geared
towards both ST and Unix. (Certainly the Makefile mentions both of
them.)

It compiled first time on the Sun4 and is currently working fine.

The version is by Howard Chu (hyc@umix.cc.umich.edu)
You can get it from any comp.sources.unix archive (eg. uunet) in
volume15.

Hope this helps.

Frank.

Has anyone seen a graphics HP terminal emulation running on the ST? I'm looking for ANYTHING, including a terminal emulator running under the MAC emulators. Preferences would lean towards the inexpensive, such as Uniterm with HP emulation, or a PD terminal emulator running under Magic Sac (sorry dsmall, Spectre is out of my price range at the moment...maybe in a year or two!).

I do have the HP alpha only terminal emulator (and would like to see source for this if it's available). Any tips on adding graphics capability would be welcome as well. Thanks. . .

> Spectre with these partitions?

Adaptec controllers will do bad sector mapping at the controller
level, if the software tells them to. The format code needs to send down
the bad sector info to the controller and have it remap those sectors. I
thought that ICD's software did this, you may just have an old version.
(I know that most of Dave's STs are using ICD controllers/software so you
shouldn't have any problem.)

2534. Summary: DEGAS to somthing standard (.IMG?)

Newsgroup: comp.sys.atari.st
Date: 1990-03-12 02:26:38 UTC
From: david@bdt.UUCP
Message-ID: <1575@bdt.UUCP>
Source record: 242578

In my adventures I found several utilities for converting Atari DEGAS pictures into something standard. Here's a summary of what I found.

CONV2IMG.PRG - Public Domain

This program was written by Criag W. Daymon. The version I have is Version 0.98, released February 11, 1990. It can convert many formats (DEGAS, NEO, Spectrum, Art Director, Mac paint and Tiny) to a monochrome .IMG file. The images are stored without any compression (IMG "bit strings").

Available on GENIE, probably other places too.

MVG - Shareware $20

This program, written by W. David Parks (aka Dr. Bob) calls itself "Dr. Bob's MultiViewer Graphica." I have the demo version 0.19L. It can load IMG, Mac, DEGAS, and Neo pictures. It is a pixel editor with manipulations such as rotate, crop, etc. It can save the picture in any of the formats. The full version is $20. The program says to send to:

W. David Parks
180 N. Hazeltine Ave.
Campbell, OH 44405-1024

I don't know yet if this is the correct address.

PublicPainter - Free Demo. Commercial product in Germany (price?)

Something called PPM from Germany. All the docs are in German. It looks nice but I don't trust the distribution I got (from Genie) which cliams to have come from an outfit in UK. I think this program tried to install a virus on my machine. It is a mono-only paint program. There is a commercial version available too, but I can't find more info on it. The program is an .IMG file based paint program. It may be able to read other formats too, but I won't use it because I think it's a hack or pirate version.

PBMPLUS - Copyrighted but free to use.

Lastly I ended up writing a few utilities for use with the PBMPLUS package that was distributed on the net (comp.sources.misc) a while back. This is a package for converting and manipulating bit-maps. It has its own "portable bit-map" format. It comes with a GEM .IMG file to "portable bitmap" converter. This was a little buggy. I ended up fixing it. I also wrote a utility to convert from DEGAS .PI3 to "portable bitmap" and back again. I also wrote a utility

to go from portable bit-map to GEM .IMG format. These programs
have been sent off to the PBMPLUS author, Jef Poskanzer. If anyone
is interested in them before they get distributed, let me know and
I'll mail them to you.

>out and buy a 520STe expecting to be able to upgrade it.

Allan, your a reasonable guy, where did you get this reply? You make it
sound like Atari Corp is not interested in doing anything to make
its customer's lives any easier. Why not ? You might consider suggesting
to your management that it is a "feature" in the opinion of your potential
customers that they can upgrade the memory of their machine. This "feature"
costs about 0.28US$ and yields quantifiable customer satisfaction.

I think this is a symptom of a bigger problem. However, a thousand mile
journey begins with but one step.

2536. Using laser printers with Spectre GCR

Newsgroup: comp.sys.atari.st
Date: 1990-03-12 02:42:54 UTC
From: ccastvf@prism.gatech.EDU
Message-ID: <6890@hydra.gatech.EDU>
Source record: 242580

A friend of mine has a pretty good Spectre GCR setup on his Mega 2, and would like to add a laser printer. Does anyone have any suggestions on one that works well? It would be ideal to be able to print directly from the application without having to exit to download postscript files or some such. I don't think one that could only be hooked up via serial port would be good since we have an Apple LaserWriter at work that for various reasons had to be hooked with RS232 and big files just take to long to transmit to it. I notice some printers have SCSI ports, and I've heard these are for the storage of extra fonts. But are these ports also useable for Atari DMA access?

I have heard rumours of Dave Small supportin AppleTalk in his next release and am wondering if maybe he shouldn't just wait for that. Then he could probably pick up a LaserWriter Plus somewhere cheap and hook it up that way.

The Atari ST is a pretty straighforward, sort of standard machine, which is
probably why it has the power and following that it does. Anyway, on
this account you should check out general computer graphics texts--they
have a number of quite inventive things to speed graphics to "arcade"
quality. You might also try a trip to the local arcade--sometimes it's
interesting to sit around and try to figure out how some of the animation
is done.

Cross-posted to: comp.sys.atari.st,misc.forsale

Atari 1040 ST, less than one year old, lightly used (OK, it was used
as a backup for my Mega 2, now on its way home from the repair shop)--

$450, or best offer, or will trade for a Spectre GCR.

The system includes: nothing but the stuff that comes with it, i.e.
the disk drive built into the side, the mouse and the cables that
normally come with it. It is in excellent condition.

Also for sale SOON:
Spectre 128, with ROMs, for whatever a used Spectre 128 is going
for (make an offer). I'll throw in a Translator ONE for nothing
(it's not worth much more than that).

For all of the hardware concerned, I'll split the shipping.

2540. DeskJet re-inking / clogging

Newsgroup: comp.sys.atari.st
Date: 1990-03-12 05:17:39 UTC
From: logajan@ns.network.com
Message-ID: <1990Mar12.051739.7549@ns.network.com>
Source record: 242584

More on re-filling HP DeskJet ink cartridges.

There was some worry mentioned a while back about re-filled ink clogging up the little plastic (sort of rubbery) hose. The hose travels from the little coupling down through a sort of artificial-heart pump (where the hose is formed in a semi-circle and a little wheel rotary pinches the hose on its way around the semi-circle) and into the base of the unit where a 4x4 inch hunk of ink blotter paper sits to collect anything.

Apparently the hose is there for two reasons. When the machine is off or idle, any ink "siphoning" will get directed into the blotter. And, secondly, when you push the prime button, the little heart pump is engaged and a bunch of ink is sucked out of the cartridge.

Which leads me to this first observation: DO NOT PRESS THE PRIMING BUTTON UNLESS YOU ACTUALLY FEEL IT IS NECESSARY -- you are just throwing away ink, and unless you re-fill your own cartridges, you are throwing away big money.

On power-up the cartridge moves about two inches from its resting place and does a different (electrical) kind of prime. It shoots some ink into a little "L" shaped groove. You can see the grove, and probably some dried ink, which you can clean if you are so motivated.

So, the hose should not get ink in it unless you press the priming button. If you do, or if you just like to clean things, or you are worried about your re-filled ink clogging the hose, do the following.

With the same hypodermic needle you used for refilling the ink cartridge, slowly squirt some water into the little "resting/priming" coupler. The water may sit there for a few seconds/minutes but it will slowly find its way down the hose. As the water level drops in the coupler, you may want to keep adding more, oh say, up to 1/4 cc. This should wash out the hose and get rid of any residue ink.

If the process seems stalled, you may want to remove the ink cartridge, power up the unit, and press the priming button. This should help draw the water through the hose. If your water DOESN'T go down the hose, then you have a clogged hose -- however, I don't consider this a likely event, and if you "wash" your hose once in a while and you don't use the priming button, it should never happen.

By the way, does anybody know what the "short life ink cartridge fix kit"
is? I mean, what is it EXACTLY?

Is the ink actually sucked out of a "short life" cartridge, or is the
ink still there but not getting down to the head?

2544. Hard disk problems

Newsgroup: comp.sys.atari.st
Date: 1990-03-12 09:58:38 UTC
From: domen@cartan.crin.fr
Message-ID: <1814@loria.crin.fr>
Source record: 242588

Some days ago, my hard disk got completely corrupted: I first noticed that some files were mixed on the disk and looking at the FATS and the root directory, I saw that a file was partly written in the root directory and some clusters were allocated to more than one file. It's actually the fourth time it happens but I never exactly identified the problem before.

I noticed that the first data cluster on the disk corresponds to the third entry in the FATS, that's to say, is numbered 2 since the first one is numbered 0. This means that the data clusters 0 and 1 are actually never used and thus marked as free in the FATS (at least on my disk which is not an ATARI disk) and that they are actually located in the root directory, exactly where a part of my files were written.

My questions are then:

1) Did anybody already experience this problem?

2) Are the data clusters 0 and 1 marked as free ($0000) on the ATARI disks?

2) Is it posible that a poorly behaved program allocates these two non existing data clusters, thinking that they are free?

This problem occured first while copying a file with the Universal Item Selector and then almost systematicaly with Turbo C.

My disk is a 30MB with OMTI controler bought at
FSE in Kaiserslautern (W. Germany).

2545. .SND FILES?

Newsgroup: comp.sys.atari.st
Date: 1990-03-12 11:36:27 UTC
From: d88pt@efd.lth.se
Message-ID: <1990Mar12.113627.11275@lth.se>
Source record: 242589

Hi,

I heard some talking about ".snd" files on the net. My questions are:

What programs use those files.

How are they stored(format).

Is there a ftp site for such files.

Thank's

2546. Re: WordPerfect & crosslinked files

From article <90030820215399@masnet.uucp>, by derek.linfield@canremote.uucp (DEREK LINFIELD):
> Have you checked your HD since you installed WP? I'm curious to see if
> others are having the crosslinked file problem I'm having.

I can confirm that on my hard disk partition with WordPerfect installed I have found (via DLII) some 'lost clusters'. I recovered them and found that they contained the text of Wordperfect documents. I believe they came from WP's .TMP files, and maybe they weren't cleaned up properly after exiting the program. It's possible that WP may at some time have been exited incorrectly.

The situation seems to have improved since I got the August 89 version of WP. I don't know if that's just luck, though.

Graham

I am trying to set a function name to an absolute value in
Turbo C:

Could someone just drop a note on how to call olderrh (the
old critical error handler) if I do not want to service the
call?

Thanks in advance

-- Greg

I have tried this and more:

```
#include <stdio.h>
#include <tos.h>

#define drivebits 0x0030

void *olderrh;

/*****************************
Critical Error Handler
*****************************/
long criterr(int err, int drive)
{
if (drive & drivebits)
return(1L);
else
return(eval(olderrh));
}

/*****************************
Replace Error Handler
*****************************/
void replerr(void)
{
olderrh = (void *)(*(long *)0x404L);
*(long *)0x404L = (long)criterr;
}

void main(void)
{
Supexec(replerr);
Ptermres(0x400L,0);
}
```

Do you Usenet folks feel that the posting of our demos of our products here is a worthwhile endevour, or should we stop?

YES, I feel that it really is worthwile to have the demos on the net.

Are Usenet folks REALLY care all that much if a commercial endorsement is made in the demo??

I DON'T care !! The demo still is free. I can use it, don't have to pay for it (although I rather use the real thing, but that's beside the point).
If there is a note, that an enhanced version is available commercially, fine.

I think, the point is: The demos Ignac is posting are *usefull*, not only advertising for the real thing and they are FREE. This is more than you can say for shareware (also no bad thing on the net in my opinion).

So, please go on posting demos, Ignac.

Disclaimer: I have nothing to do with Branch Always Software besides that I'm using their stuff, I even don't get it for free.

2550. WINDUPDATE CALLS ???

Newsgroup: comp.sys.atari.st
Date: 1990-03-12 14:12:00 UTC
From: polman@kunivv1.sci.kun.nl
Message-ID: <1167@kunivv1.sci.kun.nl>
Source record: 242594

I posted this a while back but did not receive any reaction,
so here I am again with my question for all AES goeroes.
Which calls are allowed in between
windupdate(1) and windupdate(0)
and in between
windupdate(3) and windupdate(2) ?
The question arises from the following experience:
I'm working in a GEM based shell using windows and a menubar.
When I return in the shell after a Pexec I restore my menubar
and my own desktop. Then in between windupdate(3) and (2) I
open my windows. After that the sliderbar and arrows from the
windows are ignored until I let a menu drop down from the menubar
and click it away again. Then everything is back to normal
(note I do not have to pick a menu_item). The problem only
occurs on TOS 1.4. I have already found that using
windupdate(1) and (0) solves the problem but I would like to know
what precisely causes this phenomenon and what has been changed in
AES to account for the difference between TOS 1.4 and TOS 1.0-1.2.

By the way, some time ago Ken Badertcher (sorry if I mispelled the name
but I could not find a single item from you in the last 700) posted
a detailed note on the cookyjar procedure. I thought that I had saved
it someplace but I cannot find it any more. So if someone has it, please
mail it to me personally,

Ben Polman

2555. Rwabs/Hard Disks

Newsgroup: comp.sys.atari.st
Date: 1990-03-12 15:57:29 UTC
From: adp1@csug.cs.reading.ac.uk
Message-ID: <2121@onion.reading.ac.uk>
Source record: 242599

Hello,

A)...
I tried yesterday to write a program to read in the FAT table and the root directory off a disk using the Rwabs(..) call in sozobon C. It seemed to do this fine on disks A and B, but an attempt to do this off my hard disk caused a crash/lockup on the Rwabs call.
I understand that some problem with Rwabs has been discussed in this group, but I must have missed it. Could some kind soul send me a summary of what the discussion was about and/or tell me if I am doing anything stupid!!!

B)...
The aforemetioned hard drive is one that I have just obtained. It is a Power Computing Series 900 Drive (48Mb 28ms). It came with an external power supply with a 2 pin round pin plug on it!!). It seems to have some kind of clock in it, but it is really strange, it seems to remember the time and date at which it was turned off at, as long as the length of time isn't longer than about a day! It seems to require 2 attempts at booting after being turned on for the first time, however long you wait before powering up the ST, and after resetting the ST the screen flickers horrendously (like putting the screen to 60Hz mode) before it boots and restores the white blank screen.
Has anybody else got any experience with this make of drive, and if so could they let me know if it does similar things.

Thanks,
Andrew.

2556. About the Laserwriter driver for Timeworks

Newsgroup: comp.sys.atari.st
Date: 1990-03-12 16:03:00 UTC
From: AVM@BGERUG51.BITNET
Message-ID: <9003130808.AA20112@ucbvax.Berkeley.EDU>
Source record: 242600

Hi,

I'm not a subscriber to the list, but I do have a question.

It looks like the Apple Laserwriter driver from Timeworks is communicating
with the Laserwriter. In the first place it asks for the status of the
Laserwriter, and second it asks for the kind of interface the Laserwriter
is initialized on (one of the option numbers of the Laserwriter).
If no answer comes on that question the first time, it asks it several times,
but with a timeout. If no answer came at all, it starts sending the Postscript
commands with the Xon/Xoff handshaking.

This is where my problem comes. I want the Atari to send the Postscript to
a VAX machine and from there on print to the Laserwriter. I don't want to
answer the question of the option number (the handshaking), but I want to
change the default of the printer driver in Timeworks to the DTR/DSR (
option 68).

Is it possible to do that, or am I asking a hell of a question ?

Please answer to me directly, since I'm not a subscriber to this list.

Anne-Mie Vandermeeren (avm@bgerug51.bitnet)

Sorry, I'd forgotten that this was in my home directory, and not in the ftp area. I also (mis?)remembered that uw_unix.arc had been available for some time, but it's not there now. In any case, you can now grab uw.tar.Z from ~ftp/atari/telecomm on terminator. This is the latest collection of docs & sources, plus BinHexed Mac executables. (All of this is as I originally retrieved it, so I haven't deleted anything, though it appears extraneous for my purposes...)

The server code comes with 2 makefiles, for 4.2 and 4.3 BSD.

Talking about multi-tasking, I read in Znet (I think) about Atari's Midi-tasking software which is aimed at the midi market but should be useful elsewhere. This piece of software is apparently being sold for $12.95 presumably so that people will be tempted to use it.

+ Is this software available now?
+ Will be it available in the UK?
+ Does it work with older TOS versions than 1.4?
+ Will Atari publish guidelines for creating multi-tasking software or is this included with the software?

Fanx,
Mark.

>every penny.
>
>Peter Szymonik

Let's not get carried away here. Yes, the GCR is an amazing product and it by itself works beautifully. It will NOT work flawlessly, due to other problems in the system. Namely, some really awful cut corners in some Mega computers. My Mega 2 refuses to write to Mac disks on the internal drive. It isn't a shielding problem. We shielded that drive to HELL and it still wouldn't work.

Friend of mine who works at an Atari store looked at my chipset. He couldn't recognize it... I wonder just what the h... <oops, sorry, flame off> Atari did when assembling this computer (it's a Rev. 5.0 motherboard).

(btw, it isn't the mechanism either)

Spectre GCR is great. Mega 2's aren't.

Mike

Atari 130XE system for sale. System includes the following:

Hardware: Atari 130XE, Magnavox Color 40 Monitor, Two (2) XF551
Disk Drives, and P:R: Connection (std serial & parallel
ports) with cables. ALL HARDWARE IN "LIKE NEW"
CONDITION!

Software: DOS XE, DOS 2.5, Paperclip XE (word processor), Newsroom
(basic desktop publisher), Speedcalc (spreadsheet),
disk-based games (commercial & PD), and several PD
programs (including a word processor, (2) communication
(terminal) programs, a database program, etc.)

Misc.: Two disk caddies, 40+ (DSDD) disks, dust covers
(computer, monitor and one disk drive), several books
and magazines.

The hardware alone is worth around $1000 retail. I will sell
everything listed above for $550 plus shipping or I will sell the
system *without* monitor for $350 plus shipping. Items not for sale
separately. If interested, reply to this message or contact:

david.schreiber@canremote.uucp (DAVID SCHREIBER) writes ...]

> It is IMPOSSIBLE for Nintendo to be sing "monopolistic" practices
> against Atari. Check your dictionary.

Oh, really? It says:

mo*nop*o*ly 1. exclusive control of a commodity or service in a given market, or control that makes possible the fixing of prices and the virtual elimination of free competition.

According to the Associated Press, Rep. Dennis Eckart of Ohio, chairman of the House small business subcommittee on antitrust, asked the U.S. Justice Department's antitrust division last December to investigate Nintendo.

Nintendo controls 80 percent or more of the videogames market. That in itself is not monopolistic, but:

* He accused Nintendo of intimidating retailers to keep competitors off toy store shelves.

* He said Nintendo has used exclusive software arrangements and physical computer-chip barriers to control the market. Nintendo installs a "lock-out chip" in each cartridge, and only licensed game cartridges including that chip can be used on Nintendo players.

* He said Nintendo had created artificial shortages of some games sold by licensed software producers.

* He said the result of Nintendo's marketing practices is that only games licensed or sold by Nintendo can be played on the Nintendo players, blocking independent software publishers and inflating the costs of games to consumers by an estimated 20 percent to 30 percent.

I don't think anyone is close to filing any criminal charges, but similar allegations are contained in the Atari Games (Tengen) civil suit. (Atari Games is not affiliated with Atari Corp.)

Date: 1990-03-12 17:21:51 UTC
From: djd1@csug.cs.reading.ac.uk
Message-ID: <2124@onion.reading.ac.uk>
Source record: 242610

Firstly, thanks to everyone who replied to my request for info on the
40-Folder bug - I'll try reading the FAT instead of visiting each folder.

Now..from what I have read here recently, am I to understand that even the
lastest ROMs do not fix this pathetic bug?? _Surely_ a bug like this could have
easily been fixed (although I do not profess to know the 'ins and outs' of it),
and make the ST nearer to the perfect machine than it is already?

While on the subject of new ROMs, can anyone suggest a valid reason for
purchasing them, how much , where from etc? I apologise in advance if this
information has been posted before, but I don't get to read rn that often.

Cheers,
David.

2567. Data Structures Toolkit

Newsgroup: comp.sys.atari.st
Date: 1990-03-12 17:38:02 UTC
From: swklassen@tiger.waterloo.edu
Message-ID: <21875@watdragon.waterloo.edu>
Source record: 242611

Many months ago I asked the net if anyone was interested in a
toolkit (collection of C routines) I was putting together to
work with various data structures. I only got a few responses
but decided to go ahead with the project anyway since it would
be useful to me.

I have finally completed version 1.0 of my toolkit and it is
ready to go to the net. If you are interested in receiving
it please e-mail me. If there are enough responses I will
post to the net, otherwise I will just e-mail it to those
who want it.

This initial version contains routines for various types of
sorts as well as for working with different types of lists.
It contains three libraries, described briefly below:

sorts - This library includes routines for sorting an array
of character pointers. (Which are, of course, pointing
to the data you really want to sort.) It includes
a simple linear insertion sort (inefficient but easy
to understand), Hoare's quicksort (efficient for
'average' arrays but inefficient if the array is
already in increasing order), and the heapsort algorithm
(efficient in all cases but slightly more overhead
than the quicksort.

lists - This library defines a data type called list. Two
implementations are included, a singly linked list and
a doubly linked list. Routines are included to create
lists, insert and delete stuff, move around in the
list, retrieve stuff, and catenate and split lists.
The lists are created in such a way that they can
contain any type of data. (In fact you can put a
different data type in each node if you want to.)

clist - This library defines a data type called a circular
list. These lists are similar to the above lists
except that they go in a circle (i.e. the 'last'
element will point back to the 'first' element).
Both singly linked and doubly linked implementations
are included. All the same routines are included
as in lists with the exception of catenate and split.

The toolkit is broken into three directories.
doc\ contains the documentation for each of the libraries as well
as copywrite restrictions (see below) and a list of error messages

the toolkit may produce on occasion.

include\ contains all the header files required to defined the
data types.

src\ contains arc'ed files containing the source code for the toolkit.

The entire toolkit is available in source form only. To use it
you can either #include the source files into your programs or
compile them into libraries (which is what I did) in a form
acceptable to your C compiler.

All the code has been written in Mark Williams C but should work
with any K & R C compiler with little or no modification.

If you have any problems with the toolkit (errors or ideas for
improvement) let me know and I may change them in a future
upgrade.

Copywrite information:
For complete copywrite information see the copywrit file in the
doc/ directory. Basically you can use my sources without
restriction in any non-profit application provided that you
also provide source code. If you want to use them in a for-
profit application (including shareware) you need to contact
me first. (I will rarely require money, usually I will just
ask that you put in a credit with my name on it if I think
your program is well written, or require that you remove all
mention of me if I think your program sucks.)

Once again, if you are interested in this toolkit, e-mail me
and I will either e-mail you a copy or post to the net.

2568. linear algebra package

Newsgroup: comp.sys.atari.st
Date: 1990-03-12 17:49:10 UTC
From: swklassen@tiger.waterloo.edu
Message-ID: <21877@watdragon.waterloo.edu>
Source record: 242612

Now that ver. 1.0 of my toolkit has been completed, it is time
to start working on ver. 2.0.

Currently I am planning on ver. 2.0 to included a library for
working with various implementations of binary trees, as well
as a library which I am currently just calling a linear algebra
package.

My initial proposal for the linear algebra package would include
a number of routines for finding the roots of polynomials and
for working with matrices. The matrices routines would include
finding determinants, eigenvalues, eigenvectors, norms (maybe),
row reduction (solving systems of equations), inversion, and
multiplying matrices. This is a rather incomplete list and I
am hoping that some of you out there can help add to this list.
Please e-mail me and tell me what you would look for in a linear
algebra package. What sort of routines (if you could provide
the location of algorithms, i.e. names of textbooks, that
would also be useful) would you like to see, and what sort
of calling format would you like to see. I won't guarantee
that I will use all your ideas or even that I will respond to
your mail, but I will consider all ideas.

ver. 2.0 of the toolkit (including all updates and corrections
from ver. 1.0, a library for working with binary trees, and
the linear algebra package) should be ready by Christmas but
I can make no guarantees to that effect. (Depends on how much
overtime I get at my new job.)

(P.S. If anyone wants to help write any of it, or if you already
have some routines which you have written but don't want to go
to the trouble of supporting, feel free to e-mail me and we can
probably work something out.)

>It is IMPOSSIBLE for Nintendo to be sing "monopolistic" practices
>against Atari. Check your dictionary. To me, your message sounds like
>standard American sour grapes whne they lose out to better companies. In
>Canada we are used to all sorts of unfair practices coming from the
>Americans, so few of us feel the least bit of sympathy when they're
>outwitted by somebody else.

My, how nationalistic can we get? Gee, I sure hope that someday, somehow, the Great and Noble country of Canada will be able to triumph over the Evil Americans. Isn't it funny how when we (including me, apparently, though I've never been involved in any way with inter-country trade) do it to you, it's "unfair practices" and when someone else does it to us it's "outwitting"?
This isn't the appropriate newsgroup for paranoic nationalistic generalizations. This newsgroup is for paranoic computer-loyalistic generalizations ;-) .

As far as Nintendo is concerned, you're clearly passing judgement without any knowledge of what the complaint is. Perhaps you should *ask* the details first? You may still feel the way you do afterwards (though I should point out that the "monopolistic" practices under discussion would apply to Canadian companies as well as American companies, so if, as is apparently the case, you only care if it happens to Canada, then you might change your tune) but at least you'd sound like you knew what you were talking about.

Message-ID: <9003130810.AA20242@ucbvax.Berkeley.EDU>
Source record: 242614

For all those that remember my message about screen scrolling regions
on a VT52 terminal I would just like it to be known that I was half right
and half wrong, unfortunately I was wrong in saying that VT52 can handle
scrolling regions, this is only a feature on VT100 and upwards.

However, I do have a list of VT control codes, but they are aimed more at
VT100 and upwards terminals. I will type them in and post them anyway, but
taking care to point out those that are available under VT52.

Thank you to those who politely pointed out my error, and for those
that want the list that I have, the message is to watch this CHR$(32)!!!

I'll post it as soon as possible.

Simon.

2574. Corner Clock / Item Selector

Newsgroup: comp.sys.atari.st
Date: 1990-03-12 21:20:00 UTC
From: thamer@sioux.cis.ohio-state.edu
Message-ID: <78168@tut.cis.ohio-state.edu>
Source record: 242618

Anyone know of a program that will put a small corner clock
running on your screen. I know this can be done thru NeoDesk, but
I'm running from Gulam shell.
Also is there any way to access or convert accessories to prg
files. I would love to access the Universal Item Selector, for
example, from Gulam, but now I have to exit to the Gem Desktop to
get to it.

Thanks,

-Mustafa

>Gregory gibson (213)812-4386

This might be the shielding problem that I have been hearing about. I believe there is a file on Genie about it, but basically you may have to shield your drive and drive cable with tin foil and wire (wheeee! High tech) to get the GCR to work right. If I ever get one, I will get a real technician to install it!

2576. HELP!

Newsgroup: comp.sys.atari.st
Date: 1990-03-12 22:01:19 UTC
From: clubok@husc4.HARVARD.EDU
Message-ID: <2193@husc6.harvard.edu>
Source record: 242620

Yikes! So I try to put zoo.ttp on my hard drive, and the first time I run it, my ST reboots! Well, it tries to, anyway. It seems to have some trouble recognizing the hard drive, in that it doesn't. So then I use icdfmt.prg to rewrite the partition sector, and I can read the hard drive again. But it won't boot. Actually, it does boot, just too many times. It doesn't stop booting. It sets up the hard drive driver, and the clock driver, and then tries to go to the desktop. Some garbage briefly appears on the screen, and the cycle starts over again. I can get at the stuff on the HD by booting in a contorted sequence, but it would be nice to take less than 5 minutes to boot my hard drive. BTW, it's not icdboot.sys or desktop.inf. I replaced both of those. My guess is that it's something in the boot sector. I'm using a 1040ST with a Seagate 250R, Adaptec 4070, and ICD host adaptor. Any suggestions will be appreciated. Thanks.

In <1814@loria.crin.fr> domen@cartan.crin.fr (Eric Domenjoud) writes:

>My questions are then:

>1) Did anybody already experience this problem?

Yes, first when using TurboDos from Atari France along with Universal
Item Selector II and then just when using Universal Item Selector II. I have
had no problems since I stopped using Universal Item Selector II.

>2) Are the data clusters 0 and 1 marked as free ($0000) on the ATARI disks?

Clusters 0 and 1 are either marked as 0x0000 or 0xFFF7 depending on your
controller and are not available for data. They are not used because they
don't really exist on the disk. Their presence is a holdover from the orignal
development of the FAT system on DOS machines.

>3) Is it posible that a poorly behaved program allocates these two non
existing data clusters, thinking that they are free?

Not unless they bypass the OS and program the HDC and DMA to read and write
physical sectors. If they do this and screw it up, then you can have problems.

Date: 1990-03-13 00:18:34 UTC
From: adp1@csug.cs.reading.ac.uk
Message-ID: <2125@onion.reading.ac.uk>
Source record: 242623

Has anyone else tried to compile Stevie 3.69a (from comp.sources.misc) for the ST. I tried quickly this evening, after bodging an ascii.h file (it didn't seem to come with one), under Sozobon C. After a few minor source code corrections (: instead of ;, and multiple defined functions, etc) it compiled. It seemed to work, apart from a couple of minor faults (the help function would bomb out occasionally - 1 bomb, and common to previous versions, would bomb out with 1 bomb if any of the arrow keys/help/undo etc were pressed during insert mode, ie not very usable).

The person doing the conversion said that it had not yet been tested out on the ST. (obviously...!!)

Has anybody got the time to do a thorough check, and fix of the source..??

(I haven't..... :-)

From: blee@plains.UUCP
Message-ID: <3764@plains.UUCP>
Source record: 242624

First of all: I need a moniter cable from a dead monitor.
I am building the RGB->composite converter with the instructions from
Anees Munshi (ver 1.0) does anyone have any hints/tips for me?
One tip that would REALY help is how to order the MC1377 chip, I
haven't found anywhere (read that 'even Motorola') that can get the
right order number...

2: A hint that may or may not be obvious for those of us lucky ones who
can ftp :-) when tring to find a program on terminator try:
'cd /atari', 'mget */firstpart*'
say you are looking for overscan.arc
'mget */overscan*' if it finds a match it will report the path/name and ask
'y/n', answer 'n' and cd to the path. (answering 'y' won't work)

3: A long while back I asked why Uniterm was crashing on my system, I
found out a short time later... Personal Pascal v1.0 does something bad
on 1.2 TOS. To see what I am talking about: go to any dialog menu (in
help screen, not terminal screen) select 'cancel' and quickly go up to
menu bar so that a drop down menu should come up. Vola! cursor disapers,
and nifty junk is left behind mouse!

I claim Personal Pascal is the offending software because other programs
written with it do the same thing: GEM kermit, and another that I can't
remember right now. This behavior has been confirmed by a nice person
who's name I forget. Please at least try it before flaming me!

PS: Please reply if this helps... Its lonely being a Ma***g repairman!

Wow! The response to my posting was incredible! I found out
what I needed to know, but there is no way I can reply to everyone
who sent me mail...

I'll summarize the messages I received: Basically, ARC has
already been modified for virtually every machine in existence
(the problem is finding a version near you). Apparently, there
an executable arc on terminator. (I would imagine that sources are
there too. In the 'unix' directory!) I guess I won't have
to any programming after all!

Once again, thanx again for all the help. I'll try to forward the
executable that was sent to me to those of you requested it.
I'm in the middle of finals right now, though. Take a look on
terminator.cc.umich.edu and e-mail if you can't find it there...

Yes it is true, that some Americans know very little about
what goes on north of the 49th parallel, but I still *hate*
remarks like these. I've met some pretty ignorant Canadians
too. And, I actually *like* to see a Canuck Buck that isn't
worth as much as the Yankee Dollar. :-) That is, from a
pro-Canadian economic point of view.

2583. MEGA 2 booting problem

Newsgroup: comp.sys.atari.st
Date: 1990-03-13 04:27:13 UTC
From: dinapoli@rodan.acs.syr.edu
Message-ID: <2435@rodan.acs.syr.edu>
Source record: 242627

Howdy all...

I am having a problem with my MEGA 2. When I attempt to boot up (turn the power switch on) there is a pulsating sound in sync with the rapid flashing of the power indicator light on the keyboard. I remember someone posting a similar problem with the MEGA2 a while back and I was wondering if that person could step forward and let me know what was done to correct the problem.

My machine is still under warranty, but since my company purchased it through the developers program, the only way to have it fixed free of charge is send it back to Atari to get a replacement. Problem is, they don't have any replacements handy and I would be indefinitely stuck without a machine. I *could* try to fix it myself, but that would void my warranty (opening the case). If I did that and found the problem to be something serious (that I couldn't fix) I"d be stuck without a warranty and would have to pay a replacement charge for a replacement machine. Seems like a no-win situation!

So, my question goes out to all those who have experienced this problem... If you fixed the problem that causes this pulsating, what WAS the problem, and what would be involved for me to fix it myself?

Thanks in advance

Ron DiNapoli

I suggest that you check out the Nov. 1988 (?) issue of Radio
Electronics. It's got an article on building an RGB-to-NTSC converter
and it talks specifically about using it with the ST (as well as IBM).
If you can't find this issue (and note that I'm not sure about the
issue date--the issue was around that time) I can send you a
photocopy of the article. There are a few errors in the ST monitor
pinout, but other than that it's pretty good. The author also offers
a kit which supposedly contains all the parts necessary for the ST
version of the converter (including the monitor connector) but some
of them (the monitor connector and delay line) weren't included
in the kit which I recieved. So, beware if you choose that route;
I'm still fighting to get those parts.
The kit costs something like $35, plus a few bucks for postage.
Otherwise, getting some of the parts, like the MC1377, can be
a real pain in the pooper (but, I suppose you already know this).
I hope this helps.

I wouldn't be so hard on Mega 2's. I will grant that I don't have a Spectre GCR (yet) but a Spectre 128 with a Translator, but I can say that not only will the Translator not work on the internal drive of my Mega 2, but it wouldn't work on the internal drives of half the 1040's I tried it on, nor would it work with most of the external drives I tried. Oddly enough, the external drive it works best on is my good old drive for my original 520. I think it's a matter of drive speed or some such thing, rather than the computer itself. Otherwise my Mega 2 has performed well (OK, well until the power supply died after about 5 months, but Atari did agree to fix it for free). In using a 1040 while my Mega is under repair, I appreciate the "little" enhancements to the Mega 2--you'd be surprised how much difference the detached keyboard and case design make when going back to the old system for a few weeks.

>I'm running from Gulam shell.

The software that came with the Surreal Time Clock has the option of a corner clock, but of course you need a Surreal Time Clock chip in order for it to work. If you contact the company (or the people who used to run the company, if they are no longer in business) they may be willing to divulge the secret of the corner clock. Or you could try your luck with a dissassmbler.

Eric

It sounds if this would allow TOS to run more properly on different
CPUs and clock freq. GO FOR IT!

Message-ID: <9003140801.AA17009@ucbvax.Berkeley.EDU>
Source record: 242636

Dear Net Readers:

Current Notes Magazine would like to upload some material to an FTP site as a public service. This would include some articles of recent interest, tables of contents for recent issues, and catalog listings for their PD library. I would appreciate it if the manager of any interested archive site would contact me to discuss this possibility.

Please send E-Mail to JOHNBARNES@ENH.NIST.GOV.

Thank You
John Barnes,
Current Notes' Junkyard Pussycat

P.S. One of the articles is the Junkyard Pussycat Column on "Life on the Internet" that appeared in the March issue. The piece is too long to send as a digest entry.

>I'm running from Gulam shell.

Lars-Erik Osterud (sp?) posted such a program to the net a few times ago. It diplays a cloch in the upper right-hand corner of the screen. It also displays disk accesses (e.g. << C: read from C: , >> A: write to A:). The program was called timedrv, I think. If it is not on your system, you can ftp it from sol.cs.ruu.nl, or you can email me and I'll send it to you.

Come on fellas, it was fixed. You just don't understand.

Before Tos 1.4, Every FOLDER that was touched counted as 1. If the limit was 40, then 40 touches and you started getting corruption and death.

Tos 1.4 counts 1 for every FOLDER CURRENTLY OPEN. This is now a depth problem. And you get an error message if the limit is exceeded. Now only the USER knows how deep his folders are. FOLDRXXX allows the system to be TUNED to the users needs. After all, there is a price paid for large XXX, namely lost RAM for programs.

Atari wins this one. You lose.

>

Any program that has files OPEN for writing that crashes, or is rebooted
will lose clusters for you. This is because the directory isn't updated
until the final close. Up until then, each write just keeps allocating
and filling clusters.

You may see this more with WP because it is doing document backups periodically
for you. (My wife thinks this is its best feature). So there is more
likelyhood of it writing when you forget and reboot without exiting WP.

I use fsck.prg to fix this kind of problem. It may not fix everything, but
it does this very well.

2597. Data Structure Toolkit

Newsgroup: comp.sys.atari.st
Date: 1990-03-13 15:34:17 UTC
From: swklassen@tiger.waterloo.edu
Message-ID: <21918@watdragon.waterloo.edu>
Source record: 242641

Due to the large amount of e-mail I received I have decided to post my toolkit to the sources archive. I must say I was surprised by the number of responses; when I first posted to see how many were interested (about 6 or 7 months ago) I got almost no response (only 2 or 3 replies) so I scrapped the project, resurrecting it only a short while ago when I needed some of the routines for something else.

I also received a couple of responses saying they thought my toolkit was too trivial and should contain things like AVL and B+ trees. To these people I say that you are correct and that it should (and likely will some day) but I decided to post what I have already completed so that others can use it and perhaps weed out any bugs that I have missed.

If you have routines that you would like to see in such a toolkit please let me know and I may include them in a future release. In addition, if you have code which you have written but do not want to go to the trouble of putting it in a package to make available to others, I would be interested in including relevant stuff in a future version of this toolkit.

As I mentioned yesterday, my next version of the toolkit will contain a linear algebra package. I have received a few responses as to what people would like to see in it and I would like to receive more ideas.

Thanks for all your replies.

I am just finishing a resource construction program (RCP) that I am planning on putting into the public domain. Before I post it I would appreciate some alpha/beta testing to iron out any problems that I may have overlooked. It was written with Laser C and I have tested it with GEM programs compiled with Laser C. Anyone like to help me out by testing it?
To Richard Covert: Can't seem to find a path to you to send e-mail. You are quite welcome to port xxed to MWC and to post the sources for those interested. You might want to wait until I post version 1.1, which I will do (to panarthea, binaries and sources) within a week or two. I prefer that you do not post binaries of the ported or modified code. Any ideas, fixes or modifications should be sent to me and I can then repost. This way we will keep multiple versions from proliferating.

I can upload some code that does this if you like. It is not usefull per se, it
just reads the fats on a specified disk and looks for sectors marked bad in
the FAT. Works on floppies and hard disks. Let me know if you want to see it.

>B)...
...
>with a 2 pin round pin plug on it!!). It seems to have some kind of clock in
>it, but it is really strange, it seems to remember the time and date at which

By the sounds of it it does not have a a built in clock (or at least you are
not making use of it). I have had the same thing happen with an external
floppy drive connected. I think what is happening is that enough power is
bleeding back through the DMA/floppy cable back into the ST. The power level
is just enough to keep some memory (presumably in the IKB) from loosing the
time which stored in it. This is all just a guess of course...

That's not true. I tried Gemini on two different ST's, one with the old ROMs, one with new ROMs. In the first case, I got just TWO BOMBS, but all was fine in the second case...

2602. GCC Problem

Newsgroup: comp.sys.atari.st
Date: 1990-03-13 17:57:37 UTC
From: tar@naucse.UUCP
Message-ID: <1945@naucse.UUCP>
Source record: 242646

I am currently attempting to build the GEM programming envelope library from Compute!'s ST Applications Guide (Programming in C). Since I am using GNU C v. 1.37 instead of the Alcyon C as in the book, I have run into a small problem.

In one of the functions named 'doarrows.c', there is the line:
#include <document.h>

My distribution of GNU C does not have the said header file, and I cannot find an equivalent within ANY of the header files. When attempting to compile the function, I get the warning that:

NLINES (not defined)
NCHARS (not defined)

I presume that these are defined in <document.h>. Could some kind soul who has the Developer's Kit tell me whether or not there is a <document.h> include file? And if so, what values are NLINES and NCHARS supposed to be defined as having?

Thank you in advance for any help.

I am looking for a few types of programs for an Atari 1040ST. Here is a list of a few that I need:

A GIF picture viewer
A Common Lisp compiler
A plain ascii file editor (possibly handling multiple files)
An ANSI C compiler (with all docs, and files included)
A program to unpack the files posted on COMP.BINARIES.ATARI.ST

If you have any of these files, please reply to me via mail, for I do not read this newsfeed. Thanks.

Also, try to include any notes on how to convert them back to normal programs.

James

(from their pamphlet)

The Toronto Atari Federation presents
The 1990 Canadian Atari Users Convention
Sunday April 1, 1990
10 AM - 6 PM
The Airport Hilton International Hotel
5875 Airport Road

Check us out

* Over 30 Atari Dealers and Developers
* User groups from across North America
* Hourly draws for great door prizes
* ST and 8 bit Experts
* Public Domain Software
* Products and Software for Everyone...
from the Expert to the Novice, Musicians to Gamers
* Displays of everything from Desktop Publishing to Children's
Educational products.

Seminar Schedule

Time Room Topic

12:00 A&B Meet Atari
1:00 A STOS - game creation on the ST
1:00 B Hyperlink - Hypertext product from JMG
1:30 A Quick ST II - Branch Always Software
1:30 B Stalker - ST Telecommunications
2:00 A Pushing the Atari 8 Bit to the limit
2:00 B The Atari Macintosh..Spectre GCR
2:30 A NeoDesk - The ST alternative
2:30 B Atari ST basics ... Tips and Tricks
3:00 A Intrinsic Software - Dave Lewis
3:00 B The XEGS vs Nintendo !!!
3:30 A PC Emulation on the ST
4:00 A Music and the ST

(floor plan showing only layout - no booths named except TAF and Atari)

(map of Toronto - Hotel near (Lester B.) Pearson International Airport)

If you are taking the TTC, the Malton #58 bus from Lawrence West subway
station will bring you right to the Hotel.

You could win!
This complete Desktop Publishing System from Atari.

Including: The Atari Mega ST2 Computer, SM124 Mono Monitor,
MegaFile 30 Hard Drive, SLM804 Laser Printer. As well as the
Calamus Desktop publishing software system from ISD
Marketing...Calamus Vector Font Editor and Calamus Outline.
Total valued at over $5,000.00.

Plus Hundreds of dollars worth of other prizes every hour..

Be a part of the
Atari Event of the Year!

All this with your Admission fee..
$6.00 for Adults $4.00 Children (under 12)

TAF Info Line (416)425-5357
TAF On-Line BBS (416)235-0318
Atari Corp. (416)479-1266
Hilton Hotel (416)667-9900

(end of pamphlet)

Note: I am not even a member of TAF let alone on the planning committee
for this convention. So I know very little else than what is stated above.
Contact TAF for details.

So what is my interest in all this?

I am on the executive of the Kitchener-Waterloo Eight Sixteen Thirty-two
(KWEST) Atari user group which will have a booth at the convention and
also will help organize car-pools from the K-W area.

So drop by our booth and say hi and see what we've got.

NOTES ON USING THESE VT SCREEN CONTROL CODES

Ignore any spaces in the codes that I have shown. Remember that the case
is very important. Note that the 'ESC' is representative of the control
code with the ASCII code of 27. Do not type any of the '*' characters,
they are only there to draw your attention to various aspects. For some
of the escape sequences you _do_ actually use numbers, so where you
have things like Pc = column number, actually substitute an integer
number instead.

I do not know exactly which VT series terminals these are supposed to run
on but I know that they worked on the VT320 terminal that I used during my
placement year. These escape sequences were supplied during a DEC course
but do not have any copyright attached to them so I _think_ that it
should be OK to pass them to friends.

THE ATARI ST VT52 EMULATOR

After a little research through some books I found a list of the VT52
codes implemeted in the Atari VT52 emulator. These codes are slightly

different from the above "official" codes, but try them and see. :-)

Message-ID: <1946@naucse.UUCP>
Source record: 242652

In regards to my post about help finding a particular header file,
please disregard. I discovered the necessary header file <document.h>
buried deep within the book that I am using at the moment.

Things would be MUCH easier if the authors had documented (preferably in
an index) extacly which functions/headers files/etc., can be found in
the text and which are found only in the Developers Kit.

Sorry for any wasted bandwidth.

Regards,

2609. Re: HELP!

Newsgroup: comp.sys.atari.st
Date: 1990-03-13 22:49:25 UTC
From: clubok@husc4.HARVARD.EDU
Message-ID: <2207@husc6.harvard.edu>
Source record: 242653

Okay, I'm back again with new problems. This hard drive isn't more than
two weeks old, and has been behaving very erratically. I already explained
about the failure in which it wouldn't respond until I rewrote the partition
sector, and then one of the files was corrupted. That was yesterday. Today,
it again wouldn't boot. Checking the directory, I found that all the entries
were there, but garbled. I looked at it with disk doctor, and found that
about every other byte in the directory sector had been scrambled. Also,
the directory sector had been moved from #91 to #99. I tried to fix that,
and then the HD stopped responding at all. I rewrote the partition sector
again, and it basically got fixed, except that I had to reinstall ICDBOOT.SYS,
and I had two directory sectors: the original one at #91, and the scrambled
one at #99. This is the second time in two days that things got weird, and
this time I didn't even do anything that could be a likely cause. One clue:
I get "sense 20" error messages all the time. (Once it said "msense 20.")
I know that Bill White has gotten these as well, and found them to be
harmless, but I wonder if they're related to the problem. Any ideas, anyone?
I have a Seagate 250R, an Adaptec 4070, and the ICD host adaptor. I use the
most recent version of the ICD software, and I have control.acc, starstrk.acc,
and trbocolr.acc installed, with settime.prg in the auto folder. The
applications I use include Flash, 1st Word+, Opus, TeX with dvidsk, zoo.ttp,
and lately, disk doctor. Thanks for any help!

>
> I am still getting stack overflow messages if I switch menus in dBASE III
> Plus too fast (takes more effort than before I resoldered my board socket
> but it still happens).

I can't solve your problems, but share them. If you use version 1.25 of
the PC-Speed software, fprget about it. This version was buggy. At least
on 3 different hardware-configurations it was not possible to change
DOS-partitions. also the stack-overflows happened (not only with dBase).

Using version 1.30 has made things a lot better, but it still happens
that programs hang up. But it's the nearly 'normal' rate and the
problems do not appear continously. If you get other solutions than those
posted in this newsgroup, youre kindly requested to email.

Dear networkers,

I know that this has come up before, but it hasn't been answered to the
group (as far as I can see from the archive).
Has anybody some informations about an ETHERNET card for the ST ?
If so, I'd appreciate information about

- where is it connected to (DMA, ROM port) ?
- internet protocols available (telnet, ftp, rlogin) ?
- which terminal emulations (vt200 etc.) ?
- vendor and price
- availability

If there is sufficient interest, I'll summarize the answers and post it to the
net.

Thanks in advance,
Thomas.

>I support the idea of a separate news group.
>This one is "comp.sys.atari.st". How about "comp.sys.atari.st.mags".
>Or "comp.mag.atari.st".

I don't think this is appropriate for several reasons:

1) The mags, unedited, contain things which are inappropriate for the comp.* hierarchy. They also contain duplicate material.

2) The existing mailing lists ought to be a good judge of the actual readership -- and they aren't that big, around 250 readers each. The load on the Internet is much lower for this size list than a real comp.* newsgroup. (Despite the fact that only 100 relative votes are needed to form a group, actual readership for most groups with a few hundred votes is in the several thousands. I'm not so sure a new newsgroup would even pass.)

Remember, I started these mailing lists last time the issue came up of distributing these mags via newsgroup. Although I have occasionally let the mags lag as far as 2 or 3 weeks behind real-time, I think I've provided a better solution than a newgroup, given the volume that we have.

2618. 5.25" drive problems

Newsgroup: comp.sys.atari.st
Date: 1990-03-14 07:07:00 UTC
From: euaanu@eua.ericsson.se
Message-ID: <2734@erix.ericsson.se>
Source record: 242662

I'm trying to connect a 5.25" 360k drive to my 520STE (now expanded
to 2M with 1M SIMMs). The problem is (I guess) that the step rate
is to high so the drive can't step as fast as required. How can I lower
the step rate? I saw someone mention a program to put in your
auto folder. Does anybody have this program? If so, please e-mail me
a copy.
Another problem is that the drive isn't selected properly. If I set
the drive select strap to DS1 (or any other position) the drive
doesn't get selected. I have to put the strap in the MX position,
which means that it is always selected, but then I can't use the
internal drive... Could it be that the DS output from the computer
doesn't have enough sink capability, so I have to put a buffer on the
DS output???

From: harryk@bucsf.bu.edu
Message-ID: <53918@bu.edu.bu.edu>
Source record: 242663

In the last two days I saw two articles talking about GEMINI v1.1 which is supposed to be "much-much" better than v1.0 (which i currently have)

Since I like this program very much, I would like to ask 3 questions before I decide to send my registration fee to the author(Fisher if I remember well)

1. Has v1.1 solved the problem with the GULAM Shell?
(v1.0 is not capable of running any other application after 'gulam' has been executed once)

2. Is an icon-editor included with this new version?

3. Is there any option allowing GEMINI to deallocate the memory it uses when another application is launched from the GEMINI desktop(as NeoDesk does)?

Since I don't have NeoDesk and I liked GEMINI very much, I will register, providing that at least problem#1 (above) has been solved!

Thanks in advance.......

>
> Atari wins this one. You lose.

Not quite. We have still had some problems here with TOS 1.4, necessitating
the use of FOLDRXXX.
FOLDRXXX also concerns the space available for Malloc headers.
Atari has improved that now also but at a very bad cost.
In one program I had Malloced more than 100 memory blocks of 16 Kbytes
(clearly a Mega-ST). Then I released these blocks. After that the computer
was for about half a minute nearly unusable, because the internal
garbage collection in GEMDOS to set all the blocks straight
`take some time'.
So Atari has solved the problem only half. There are fewer bugs but it is
still a very poor solution.

Another question: How comes that on MS-DOS the floppy is so much faster
(and noisier)?

Adaptec sells a SCSI to Ethernet board.
Installed, it cost $500-$1000 per node; so not much work has been done
in the Atari world to support it with software.

Modern SCSI interfaces for the Atari, such as the BMS-200 can handle chaining
these boards along with the Disk Drive interfaces.

Thanks for the reply, Howard. From Ignac's post, I assumed (get's you in trouble sometimes) that the bug was in its original annoying form. If, as you say, the "problem" has been made into one of limited depth then I guess for most users that is enough of a fix. Sorry if it seemed like I was being harsh. <blush>

Ken Clubok
clubok@husc4.harvard.edu writes about problmes he's having with his hard drive, to wit, lots of bad sectors, problems reading from the disc, etc.

One thing to check, if you've assembled the drive yourself, is to see if the Adaptec controller card is sitting too close to the drive's own controller electronics. I had a variation of your problem which went like this:

Everything opened up and laid on the table--drive, controller, BMS board; in this configuration, everything was seperated, and the drive would format and read/write just fine.

Everything boxed up in the case, Adaptec board mounted to bottom of drive, next to drive electronics: Can't format drive, too many bad sectors.
(So how come they put mounting holes for a controller on the bottom of the drive then???)

Cobble up a mounting bracket, move Adaptec to top of drive. Now the drive controller cable (34 pin) and drive data cable (20 pin) are coming up the back of the drive and over onto the Adaptec; they are no longer running next to the drive electronics. Result: Can format drive, and use it, but get intermittent read/write errors, (often filenames 'change' with one or two characters becoming garbage).

Ok, now I'm getting pissed. Get out the aluminum foil and the soldering iron. Make a sandwich of cardboard and aluminum foil (carboard outside) and put one between adaptec and drive. Do the same thing for the back of the drive, so that the drive control and data cables are outside of the sandwich, and the back of the drive is on the inside. Do the same for the bottom of the drive. Enclose my SCSI<->ASCI board in another couple of these sandwiches. Run ground wires from the aluminum to the ground on the various boards.

Everything works fine now. Shees!

Moral: You may need shielding, lots of it.

Hope this helps!

2631. PostScript output for TimeWorks Publisher.

Newsgroup: comp.sys.atari.st
Date: 1990-03-14 18:14:55 UTC
From: mrose@libserv1.ic.sunysb.edu
Message-ID: <6477@sbcs.sunysb.edu>
Source record: 242675

Hello everyone!

This is my first post so I am sorry if there are any mistakes. I am in great need of a program to redirect PostScript printer output from TimeWorks Desktop Publisher to a file. Does anyone have a program to do this?
I want to save the file to disk then upload it to the schools laser printer.
I need this program as soon as possible. I can be reached at:

mrose@csserv1.ic.sunysb.edu
or
mrose@ccvm.sunysb.edu

Thank very much, sorry to use up bandwidth! :-)

-Michael Rose

2632. Using GNU emacs on the ST

Newsgroup: comp.sys.atari.st
Date: 1990-03-14 18:39:50 UTC
From: mreiss@ncrcam.Cambridge.NCR.COM
Message-ID: <1826@ncrcam.Cambridge.NCR.COM>
Source record: 242676

Hello,

I have finally had time to play with GNU emacs on the ST (thanks Mr. Roeder).
I have gotten most of it working, but I am still having two problems.

First, I cannot get the shell function to work. I have a 1040 upgraded to
4 meg of memory. I tried setting up a ramdisk, but that didn't seem to
help either. I either get an cmd exit error -33 or 2 bombs from gulam or
4 bombs "Illegal Instruction" from msh. Anybody have any ideas.

Second, I cannot get the mouse functions to do anything but move the mouse.
What am I missing. The cursor will not move. What should I do, include or
initialize that I am missing.

Any help is appreciated.

mike

2634. 5.25" drive problems on the STe

Newsgroup: comp.sys.atari.st
Date: 1990-03-14 21:02:09 UTC
From: opielask@clutx.clarkson.edu
Message-ID: <1990Mar14.210209.21517@sun.soe.clarkson.edu>
Source record: 242678

From article <2734@erix.ericsson.se>, by euaanu@eua.ericsson.se (Arto Nummelin):
> I'm trying to connect a 5.25" 360k drive to my 520STE (now expanded
> to 2M with 1M SIMMs). The problem is (I guess) that the step rate
> is to high so the drive can't step as fast as required. How can I lower
> the step rate? I saw someone mention a program to put in your
> auto folder. Does anybody have this program? If so, please e-mail me
> a copy.

I have an INDUS GT-1000 external 5.25" drive, and my 1040STe hates it.
The booting software that came with the drive won't work on the STe.
And Future Systems (the makers of the drive) knew nothing about it.
They were nice enough to send me another program that they thought might
help, but no...

Recently my drive was giving me a NEW problem! (besides the fact that if
the GT-1000 is connected and off, the internal drive corrupts disks when
it trys to write to them)..
When I try to look at the external disk, it wants me to insert disk B into
drive A, as if the external drive wasn't even there!! BUT, to make things
weirder, PC-DITTO accesses it fine!!
I tried it on a friend's MEGA2, and had the problem the first time, rebooted
and didn't have the problem since... On my computer either (but I haven't
tried it many times...)

2635. 520 ST schematics

Newsgroup: comp.sys.atari.st
Date: 1990-03-14 21:05:21 UTC
From: logajan@ns.network.com
Message-ID: <1990Mar14.210521.834@ns.network.com>
Source record: 242679

> I read your reference on the .edu Atari bbs on cct schematics,
> could you please give me the details of the appropriate book,
> so I can try & get hold of a copy, ie title , year, authors,
> or ISBN no, or lib. of congress no.

The original 520 ST schematic (circa 1986) appears in a publication supplement to Sam's Photofact service. Sam's publishes schematics for consumer electronic products (TV's, radios, personal computers, VCR's etc.) They sell these schematics to radio/TV repair services. Libraries often purchase sets of these schematics for public reference.

Each year, Sam's also publishes an Index organized by manufacturer of all their published schematics. So one would first look in the Photofact Index to find the actual Photofact publication number for a given product model number.

In the Atari 520 ST case, it is published in a separate category called Computerfacts, something like number CSC12 ?

Not every library will have Photofact sets, nor do I know the extent of international distribution. If your library has Photofacts at all, there is a good chance that they have the Computerfacts set. Otherwise they probably don't have it.

You might also want to check and see if a similar publication exists in your own country. Again, check with your library.

2637. Spectre GCR,Multisync Mon,Cordless Mouse

Newsgroup: comp.sys.atari.st
Date: 1990-03-14 21:52:31 UTC
From: gibson@trwrb.UUCP
Message-ID: <307@trwrb.UUCP>
Source record: 242681

Spectre GCR:
A few days ago I posted an article stating I could not get my Spectre GCR to read Mac disks. Well, I have solve that problem. My GCR to Mega 2 cable was to loose. The rubber insulation on the cable fitting was to thick for flopy disk port on the back of the Mega2. I used a knife to remove about 1/8 inch of rubber so the cable would fit tightly. Now my GCR will read, write, and format Mac disks.

The Spectre GCR will also read Magic Sac formated disks.
Also, I did not have to reformat my hard drive when I converted a Gemdos partition to a Spectre partition. The Spectre GCR will accept hard drive partitions created by the Magic Sac but a Magic Sac partition does not work as well as a Spectre partition. The Spectre uses HFS and the Magic Sac uses MFS file system. So I copied the files from my Magic Sac partition to my Spectre partition and convert the Magic Sac partition to a Spectre partition.

I also managed to transfer a spreadsheet .wks file created by VIP to the Mac for loading into Excel. I did a xmodem binary upload to a mainframe followed by a xmodem binary download to the Mac Mode. The download must be done with MacBinary disabled.
I am very happy with my GCR.

Multisync:
I received letters asking me about my Nec GS(black & white) Multisync monitor. I got an article from comp.sys.atari.bin describing how my friend made the box that allowed me to use the Nec Multisync GS in all three Atari screen modes, High, Med, Low Res. The box works on both the color and b&w Nec Multisync. My box cost about $40 to make. At that time, the Atari monitor plug cost $20. I also had to buy a case, switches and resistors.
These boxes are currently commericallly availble. In the "ST Informer", one such box is advertised:

Talon Technology Group
(619) 792-6511

Omniswitch $90

The GS is as good as the Atari in mono mode. However, I expect my GS to live longer than my Atari mono. The GS is better than the Atari for text in medium mode.

The GS will also work is low rez mode. The low rez mode picture is sharp and clear. The Atari color monitor is better than the GS in low rez mode however, the GS is an acceptable option. Also, the GS does not have a speaker or amplifier.

I use two monitors, the Atari color and the GS. I use the monitor switch box made by Practical Solutions to switch between monitors. This switch box provides a audio RCA plug (stero plug) that I have connected to a tape recorder to provide sound when I am using the GS.

If I were forced to used only one monitor, I might lean toward using the Nec GS multisync instead of the Nec color multisync because of the GS screen is excellant in high res mode.

Cordless mouse:

I have had the cordless mouse for over a month without changing batteries. The mouse shuts off when not in use. The cordless is more comfortable to use than the Atari mouse. However, the Atari mouse seems to respond faster to quick left and right motion than the cordless mouse. The only time I see the difference is when playing a game that requires quick mouse motion.

2639. NEC P560XL Printer FOR SALE

Newsgroup: comp.sys.atari.st
Date: 1990-03-15 00:17:54 UTC
From: aman@xroads.UUCP
Message-ID: <1010@xroads.UUCP>
Source record: 242683
Cross-posted to: comp.sys.amiga,comp.sys.amiga.hardware,comp.sys.atari.st,comp.sys.mac,comp.sys.ibm.pc,misc.forsale

I have an NEC P5XL 24-pin dot-matrix wide carriage color printer for sale. It is 100% Epson LQ Compatible, in brand-new condition, and has 360dpi resolution and has 350CPS speed. It is a rugged, well-built printer that has one of the best MTBF (Mean Time Before Failure) ratings of any printer on the market. The printer would be best suited for a business type environment where it would be printing constantly (has a built in fan that kicks on when printing to cool printer). I have several ribbons (including color) as well as the tractor feed option (printer also comes with cut-sheet guide) that I will bundle with the printer for no extra charge. I am asking $650 (firm) for the printer as the printer is worth $750 used at this time. Anybody seriously interested please send me mail!! I will ship it COD ONLY!

Chris Minshall

p.s.
The printer is also compatible with any software that works with an "NEC Pinwriter"![A

2640. LYNX info--as in ordering; WHERE/HOW TO...

Newsgroup: comp.sys.atari.st
Date: 1990-03-15 01:59:59 UTC
From: kar7481@cuphub.cup.edu
Message-ID: <4950@cuphub.cup.edu>
Source record: 242684

FOR THOSE OF YOU WISHING TO OBTAIN A "LYNX":

The Sears catalog order number is: 1-800-366-3000 (24hrs., toll-free)

You MUST ORDER BY ITEM NUMBER!!!

Here are the item numbers I have for what's available:

(*all prices are un US dollars--This number accepts SEARSCharge or MC/VISA
or DISCOVER chargecards)

Item Price Order Number

Atari LYNX.....$159.00.....49-TD-75425

ElectroCop.....34.50.....49-TD-75431
Blue Lightning.....34.50.....49-TD-75434
Gates of Zendocon.....34.50.....49-TD-75432
Gauntlet-III.....38.50.....49-TD-75433

Comments:

ElectroCop---- Kinda like RoboCop.....same idea basically...

Blue Lightning---- *THE BEST DAMN GRAPHICS OF ALMOST ANY FLIGHT/ATTACK
SIMULATOR!* Better than "Afterburner" on ANY platform
including the arcade-level.
Yes. This game is THAT good!!! Blows away all
implementations of Afterburner. The Trench/canyon
flight sequences are GGRREEAATT!!

The Gates of Zendocon---- A Defender-like combat game. Compare with
R*Type; except only better!
[Yep. This is also HIGHLY recommended!]

Gauntlet-III---- :-(THIS SUCKER *STILL* HASN'T BEEN RELEASED to my knowledge.
Rumored to support 4 LYNXs (4-players) in daisy-chain
type configuration...

NOTE: CALIFORNIA GAMES IS INCLUDED!!! This one blows the ST version away!
[almost...] :-)

I hope this helps some of you LYNXless NETrats.

Hello Everyone!

I am still trying to find a program to redirect output from the serial port to a disk file (to save postscript output from TimeWorks Desktop Publisher to disk). If anyone knows of such a program please send me the file as soon as possible. In the meantime my friend is currently working on a program to do this, however he has not ever used f_force before, and can not seem to get it to work. Does anyone know how to use f_force properly, or know of another way? I know UltraScript comes with a program to save TimeWorks Desktop Publisher PostScript files to disk to be printed by UltraScript, so I know that it is possible.

I am in desperate need of this right NOW!!! Someone please help me! :-)

I can be reached at:

mrose@ccserv1.ic.sunysb.edu
or
mrose@ccvm.sunysb.edu

Thanks again, sorry for taking up bandwidth! ;-)

-Michael R. Rose

p.s. I haven't made a signature file yet! ;-)

Sams Photofacts can also be ordered from:

Howard W Sams + Co
4300 West 62nd St
Indianapolis, Indiana 46268 USA

Phone 1-800-428-SAMS

The Atari 520ST is in Computerfacts CSCS12.

I'm not sure of the price, but it is probably in the neighborhood
of $30.00 American. Could be more, could be less.

2646. Hooking a Microsoft mouse to the ST

Newsgroup: comp.sys.atari.st
Date: 1990-03-15 08:06:26 UTC
From: HEIMBIG@WSUVM1.BITNET
Message-ID: <9003150806.AA14089@ucbvax.Berkeley.EDU>
Source record: 242690

Thanks Mickey for reposting Jeffs note on connecting MS mouse to ST

HOWEVER, It appears to me that microsoft has changed their mouse cable
the number of lines and the shape of the connecter are very different
from what you described. (I have the latest MS 400 DPI serial-ps/2 mouse,
did I make a mistake? should I have gotten the bus mouse?)

For example pin 5 on the MS mouse isn't connected to anything in mouse
also on my ST mouse I can press the left button and note resistance on my
volt meter go to zero when I make the approriate connections (between pin 6
and 8) I cann't find any equivalent correlation on the MS mouse, (Though
I haven't tryed every possible iteration). Strangely, resistance does drop
(electricity travels through, me no EE;) through some combinations
of lines but pressing mouse buttons never seems to make any difference.

The MS mouse apears to use only lines 2,3,4,5,7 of an AT (9 pin) serial
connector (and the casing)

Can someone e-mail me the solution to this problem (the correct wiring,
or tell me I goofed and bought the wrong mouse).

by the way I haven't received anything form info-atari16 for about a
week so you better e-mail me directly.

signed,
desparate

Thanks,
Bruce Heimbigner

I have started today a new collection of Atari ST PD programs
at funic.funet.fi (128.214.6.100). Directory is pub/atari and
its subdirectories.

This machine is part of FUNET (Finnish University Network) project
that is meant to be the central anonymous ftp site in Finland.
You can find as well many other directories (mac,msdos,amiga
etc) there. This site has special features...

Mail concerning Atari part of this site can be addressed to:
----
atari@funic.funet.fi OR hv@funic.funet.fi OR hv@uwasa.fi

Be forewarned that this start is a little bit slow one because
I'm afraid that time can be the problem.

2652. GEMINI: I love it! (2 questions, 1 hint)

Newsgroup: comp.sys.atari.st
Date: 1990-03-15 14:51:00 UTC
From: STOOP@KVI.NL
Message-ID: <C46B6D5ED85FA0129B@KVI.nl>
Source record: 242696

It's been mighty quit out here on the net lately. Figure everyone with TOS 1.2
and up is trying to figure out GEMINI... I got my copy from LISTSERV@UOGUELPH.
It came with the latest AMC_GDOS and CLIPBOARD.ACC.
<> Query: Anybody know of progams supporting CLIPBOARD.ACC?
<> Question: First thing I did with GEMINI was copying the
sexiest-you-ever-saw icon of TEX.TTP to the desktop and rename it TeX.
Info on this icon says now it's an "alias" of E:\BIN\TEX.TTP. On the disk
with label TEX.DSK.
Dragging a *.tex file icon onto the TeX icon now starts TeX running in the
console window. Next successfull thing was to set the following alias in
mupfel (the shell that runs in the console window):
alias latex 'tex &lplain'
Typing
latex small.tex
now yields the expected results. This aliasing saves me a shell script
latex.mup. Now you can guess wat I wanted and tried (unsuccessfully):
Having an icon for the alias latex 'tex &lplain' (no shell script).
I tried this by editing GEMINI.INF but most of the time this resulted in the
icon not being executable.
<> HINTS: Throw away gemini.inf as it contains a lot of useless and annoying
settings that you cannot get rid of otherwise.
BOTTOM LINE: I am very much tempted to trow away the best shell i ever had
(so far): GPshell (CRAFT) just like I did with GULAM after I got GPshell.

CONGRETULATIONS TO THE MAKERS OF GEMINI

2653. RAM Chips

Newsgroup: comp.sys.atari.st
Date: 1990-03-15 15:04:32 UTC
From: felner@inf.ethz.ch
Message-ID: <16426@ethz-inf.UUCP>
Source record: 242697

I am doing my own 2/4 MB RAM expansion for my old 260ST. However, 1MB Chips and SIMMs are terribly expensive here in Europe. Since I am soon going to New York City for a few days, I'd like to buy the stuff over there.

Therefore, does anybody know of a place in NYC where I can get this stuff cheap (like $9 per 1MB chip or $80 per 1MB SIMM). It should be somewhere in Manhattan.

Also, what speed do I need. As far as I know anything less than 150ns is OK. Is that correct?

Any pointers appreciated.

Thanks, Tomas

TOS 1.4 and TOS 1.6 (STe) have added a BIOS call to change the floppy
seek rate without punching numbers into memory.

```
XBIOS function 41
oldrate = Floprate(devno,newrate);
short devno,newrate;
devno is 0=a 1 =b; newrate=1 12MS, the slowest for 5.25 drives.

MWC assembler:
move.w $1, -(a7) / slowest
move.w $0, -(a7) / or use $1 if drive B:
move.w $41,-(a7)
trap 0x14
addq.l $6, a7
```

All the descriptions of Malloc() that I've ever seen include the information that you should not malloc more than 20 blocks per process. This is a fundamental limitation, and Atari never said they removed it. You should Malloc bigger blocks and then parcel out sub-blocks, see dLibs' malloc() for an example.

PS Yes, Jos, I know you know this, I'm not trying to insult your intelligence.

Well... It looks as if the problem is still there.
My computer will recognize the external Indus GT-1000 5.25" drive,
MAYBE once in 15 boots, and no matter what programs I boot up with.

BUT, pc-ditto recognizes it EVERY SINGLE TIME.

WHY?

I am going to check the cable, but I doubt I will find it faulty.

ANY help would be appreciated.

About Gemini 1.1:

> 2. Is an icon-editor included with this new version?

I'm not sure, but if someone can mail me a copy of Gemini,
I'll see if I can't make it work with PiE (which I'm doing
a complete re-write of, anyway). Also, if anyone knows the
file format of Gemini icons, it'll be a piece of cake for me
to make PiE write 'em out that way.

(PiE is my icon paint system)

I know you are all getting tired of reading about this phenomannon (sp?) but it happened to me in a way that sounds unique. I've had it in WordWriter ST, but now I got it while in my desk top. Heres what happened.

I was trying to put Uniterm in an AUTO folder so I could (be lazy) and run it as the computer was turned on. It didn't work (any ideas?) and I got 4 bombs (I for got what that means) and then after the bombs I was returned to my desktop. I couldn't do anything without noving the mouse after it. To open a file I had to double click it then move the mouse. I was uning no desk acc's just my 1040 ST(f) with 1 meg and TOS (1.2 I beleive).

I was able to replicate the problem every time I tried to boot up with the uniterm program in an AUTO folder.

2664. XEDIT-like editor available

Newsgroup: comp.sys.atari.st
Date: 1990-03-15 20:27:00 UTC
From: BD05@DKAUNI2.BITNET
Message-ID: <"90-03-15-12:27:34.74*BD05"@DKAUNI2.BITNET>
Source record: 242508

Roland Waldi
Universitaet Karlsruhe DESY
Inst. fuer Exp. Kernphysik F15
Physikhochhaus, P.O.Box 6980 Notkestr. 85
D-7500 Karlsruhe D-2000 Hamburg 52
Tel. (721)-608-3559 (40)-8998-3637
BD05 at DKAUNI2.BITNET F15WAL at DHHDESY3.BITNET

A few months ago I asked whether there is interest in an XEDIT-like editor. From the replies I got the impression, that there are people who appreciate this kind of editors, but certainly not as many making extensive efforts - like writing a good manual - worthwhile. So I decided to put WEDIT as is out as shareware. It has been posted to Steven Grimm at panarthea; I think you can obtain it from there already (you are really fast, Steven!).

If you dislike XEDIT, don't waste net bandwidth to obtain WEDIT; although it has additional features like file wildcard support, it will not be to your liking.

If you like XEDIT, or are open minded to concepts different from UNIX, you will probably like WEDIT and can give it a try.
For comparison, I did some benchmarks with a 6000 line file on a Megafile 60 harddisk (for more details, see WEDIT.INF):

Editor	load	search	change1	change2	store
WEDIT 1.00	21s	4.6s	97s	8s	8s
TEMPUS 1.01	6s	2.6s	91s	11s	9s
GNOME 2.1	36s	25 s	290s	147s	33s
1st_WORD 1.06	170s	150 s	560s	340s	240s

Here are also some words about CMS and UNIX: This is a matter of taste, of course, but to correct the bias on this net: Many people I know - including myself - prefer CMS to UNIX. Of course, you have to have the appropriate tools, a bare system of either flavour is rather cumbersome. In this sense, I think that UNIX-systems could gain much in user-friendlyness, if an XEDIT-like editor existed in their world.

Moshe Braner wrote a very similar program called Barrel some time ago to capture output destined for the printer (thank you Moshe!). I found it relatively easy to use his techniques to capture output destined for a printer on the parallel port, translate escape sequences intended for a daisywheel printer into the appropriate codes for my HP Deskjet, and send them back out to the serial port. It would be very easy to convert his original program to capture serial output to disk. I would expect that Barrel would be available on a number of archive sites. If not I suppose I could repost it here.

2673. SCSI controler...

Newsgroup: comp.sys.atari.st
Date: 1990-03-16 03:32:41 UTC
From: blee@plains.UUCP
Message-ID: <3790@plains.UUCP>
Source record: 242517

I am puzzled from the inconsistancy I see in SCSI controlers. I seem to hear of many problems with the ICD controler, and that the BMS controler handles more and better commands (group 1). With that in mind, I look in most ads and postings and see that ICD predominates... What am I missing? They seem even to be listed for the same price, which confuses me even more.

On a side note: Will someone give me the list of GOOD drives or rather ones to keep away from (I am thinking about the N series of Seagate).

Concerning Personal Pascal: I was told that the reason for the mouse screw-ups were because of improper order of calls... I have no experience with this, whether this is internal to PP or was caused by the individuals I have no idea.

Of course I have no connection with Seagate, Berkley Micro Systems, or ICD...

2675. Midi Rings

Newsgroup: comp.sys.atari.st
Date: 1990-03-16 04:54:29 UTC
From: scott@vortex.uoregon.edu
Message-ID: <1990Mar16.045429.21246@cs.uoregon.edu>
Source record: 242519

I was thinking recently about how to crunch some big problems that
are very well suited to parallel algorithms and not knowing much about
networks thought this:

Connect several ataris with midi cables in a ring so that
the one on the left sends output to the right and gets input
from the left. You then assign each computer a reference #
and just preceed any packet with the number.

To send to one computer send the packet to the right.
If a computer receives a packet not for it, it just retransmits.

This would work great for raytracing and I bet it would be
really cheap compared to more expensive machines plus you could
play some really neat games.

Also, I need some help to read my atari disks with my source code on my
new 386 machine. They are the same format aren't they? What do I do to
the disks so my 386 can read them? I need to be able to do this with my
386 since I can't get to the atari for quite awhile. Thanks.

>
>Wayne

Here're a couple of my function key definitions. (I only use 3 or 4 total
anyway...)
F1: %cop(1,$PATH)%pa('n:\\bin')%ru('gulam.prg','')%pa($1)
F2: %inp('Zmodem Rec:')%ru('c:\\comm\\zmdm\\rz.ttp',$temp)
F3: %inp('Zmodem Put:')%ru('c:\\comm\\zmdm\\sz.ttp',$temp)

There are probably other good ways to do this, but this works for me.
The F1 definition saves the current path into variable 1, sets the path
to my bin directory so gulam will find it's gulam.g file, runs it, then
restores the old path.

The Zmodem Receive and Put definitions prompt for a filespec, which is
left in the temp variable, and uses that as an argument to rz or sz.

Put as much system buffer as you can spare, since rz and sz will both
use all of available memory as file buffer. The smarter statement, I
suppose, is put as much as you will need - 128K plus the size of the
largest file you expect to transfer would be a good guess. On my Mega-4,
I use 2 Meg, so Gulam isn't crippled when I spawn it off.

Source record: 242522

Hello, world!

I've read the mails about trouble with Gemini and I am very
sorry about this. However, this version was not posted by us
(the authors). Someone else has done that. We never thought of
delivering Software with german documentation to the english
speaking part of the world, because you really need the docs
to use all its features.

Another point is that you got the first version of Gemini
(Gemini 1.0) and not the actual version 1.1. But we cannot
deliver Gemini 1.1, because it is completely german, even the
menus and dialogs.

Yes, we will make an english version, but this will take a little
while.

I'm sorry about your problems. We want to make good software.
Don't be too much disappointed, watch out for the 'official'
version.

Thanx.

```

>

In the days of youthful enthousiasm I disassembled and discompiled
GEMDOS. It turns out that the OS-pool is a common area for all
internal headers. They are sitting there in the order that they are
needed. In the old version it was impossible to really return these
blocks to the pool, and because these blocks have different sizes there
would be a horrible mess and once you allocated a block for a malloc
header it could only be used as such afterwards.
There was room for a little over 200 malloc blocks or a little over
40 pairs of folder blocks (each folder needed two).
So having more than 200 mallocs going at the same time would transform
the 40 folder bug into a 2 folder bug (I tried this out once by running
only on a floppy with a little program that did this type of malloccing).

In TOS1.4 the blocks are returned to the pool (as far as I understand,
because I haven't disassembled that one). This is a great improvement.
In addition the folder blocks are released when they aren't needed
anymore (that was the main part of the 40-folder bug).
That I am greatful for.

Apparently now the rule is to limit the malloc calls to 'not too many'
because the mechanism that returns the blocks to the pool has rather
poor behaviour in the limit that the number of malloc blocks is
large. I found this experimentally because I had a large file in an
editor, and after its garbage collections after a global replace
were rather funny. So the first suspect was the editor. But on other
systems it behaved properly, so this made GEMDOS suspect.

The size of 16 Kbytes was taken with great care:
If the blocks are too large there is inefficient use of memory when
the last block is allocated.
If they are too small you need too many of them.
Other problem if they are too large: This size keeps the time of the

tasks in the own garbage collections quite reasonable, so you never notice them at all.
Problem with dynamic sizes: You need more code and it is slower.
In micro computers you want too keep the size of your tools as small as possible.The 16K worked perfectly till the garbage collections of GEMDOS gave it some annoyance factor.

This was what I was trying to explain, but I admit I was a little terse about it. Over the whole TOS 1.4 is a great improvement, but I believe there is still room for a TOS 2.0

You must first do a call to get_bpb before attempting an Rwabs to the hard drive. You should also use 0x10|rwfkag when using Rwabs on the hard drive.

From my experience anyway.

P.S. Supra & ICD have told me that their drivers support using -1 for secno and an added long on the stack to read physical sectors.

Gemini keeps all of its icons in a separate resource file. KResource works fine for editing them, and I'm sure the same applies to any other Resource File Construction Kit (you can also copy icons from other resource files). Remember, though, that for every big icon you have to have a corresponding little one. Go nuts!

> good mouse...
>
Actually, it uses 2 AAA batteries, and for me they last about a week. It all depends on how much you use it. (My computer gets almost constant use. After my first set of alkalines died, I went to the store and picked up 2 sets of GE rechargables (about $6 a set), and a charging unit (about $10). I have had NO problems with these batteries. The only problem I seem to have is when I move the mouse in very small amounts (Fine adjustment of the pointer to click on something small) it seems to hesitate. Sometimes if I move it slow enough, I can move it across my whole mouse pad without moving the pointer. Has anyone else noticed this? I would appreciate receiveing E-mail from people about this, because if it is a problem with my mouse alone, then I would like to get it replaced. If it is a problem with the design of the mouse (ie a feature) I will just have to get used to it.

If you respond to this here, please also send me E-mail, because I will be at home for spring break and will probably miss it.

Thanks

Actually, according to an article in April's STart magazine (Vol4, Number 9):

"Atari has filed suit against Nintendo and
codefendant Pepsico. The suit cites
false advertising, unfair trade practices
and unfair competition. All this comes
as a result of ads that Atari claim
were deceiveing because of references
to nonexistent color features on
Nintendo's GameBoy. Nintendo is
currently under Federal investigation
for alleged monopolistic competition
and unfair trade practices."

>sense to me!
>
The so-called 40-folder "bug", which caused TOS to waste memory in its
static memory pool and to misbehave when that pool was exhausted,
was fixed in TOS 1.4. But the pool is still statically allocated,
and you can still run out of TOS memory. foldrxxx.prg doesn't "fix"
anything. It simply lets you increase the size of that pool. In TOS
1.0 this lessens the chance that the "bug" will bite. In TOS 1.4 it
lessens the chance that TOS will run out of its private memory.

Before you spend the time/energy/money on a clock, consider whether you're
going to upgrade to a hard disk drive. Most of the currently available
SCSI host adaptors have onboard clocks.

Yes the Dallas semicon. Smart Watch will work.
Their basic unit is built in a socket that you put under a ROM.

This works, as is, on earlier ST 512's.

When the power supply was added for the ST1024 it was placed over the row of ROM chips. Some third parties have made a little paddle board that allows the ROM socket to be remoted so that it is not under the P.S. This allows normal use of the Dallas component.
Terrific Corp, St Marys MA, USA is one such supplier.

No, I discovered the same problem, too.
Who can help?

GEMINI (mufpel or whoever) wants SHELL_P to be in a certain state (thats why you have to run shell0.prg before running gemini). Gulam changes shell_p, but never restores is back to what it was. this causes heart aches for gemini. writing a simple wrapper function which saves shell_p execs gulam, and retores it before exit should solve the problem, until gulam is fixed to behave itself.

> 2. Is an icon-editor included with this new version?
No.

Use any old icon editor (there must be alteast a dozen pd ones), go into a resource editor (i use rcs3), and replace the images in gemiinc.rsc.

a request to the authors of gemini: please distribute the .dfn files along with the .rsc files in the next release. this will make life much simpler when hacking the resource files.

nice work!

I'll say what I've gathered. The only SCSI controller for any personal
computer that handles the Seagate 296N at 1:1 interleave is the BMS-200.
That's the most finicky drive around, as far as timing of commands and
responses is concerned. There are lots of nice things about the BMS-200.

ICD makes a line of products incorporating their own host adapter, and which
work best with the controller software that ICD writes. Their host adapter
allows the longest cable run between it and the hard drive.

So the BMS card is a better reduction to practice of the 'ideal' SCSI concept,
while the ICD card is the cornerstone of a system of available accessories.
You get what you need more, I guess.

> SIMM now costs here 890 FF (about $ 150), and a 4160 STE is 6990 FF ($ 1100

It may be true that upgrading a 500k ST to a 1M St would be cheaper than
buying a original 1M machine, but in any case, ATARI is not going to sell
any 500k machines in future (and they don't sell them now either).
The minimum ram size is 1M.

2693. MULTISYNC RECOMENDATIONS

Newsgroup: comp.sys.atari.st
Date: 1990-03-17 00:37:33 UTC
From: MBERNAR@ERENJ.BITNET
Message-ID: <9003170802.AA10398@ucbvax.Berkeley.EDU>
Source record: 242548

Bruce Szablak complained about what he termed as "shadowing" in multisync monitors when used in the ST hi rez mode. My guess is that this is a problem with the cable instead of the monitor. Most cables I've seen don't use 75 Ohm coax cable for the monochrome video output. This impedance mismatch between the ST's video output and the monitor's input results in the "shadows" in the horizontal direction. This effect is more noticable in the high rez mode since the scan rate (I can't remember the exact number) is much higher that the medium and low rez modes.

In addition, the common practice of connecting the monochrome signal to the Red, Blue and Green video inputs of a multisync monitors adds to the mismatch.

Regards,
Marcelino Bernardo

2697. Re: Redirecting output from serial port to a disk file

Newsgroup: comp.sys.atari.st
Date: 1990-03-17 02:34:47 UTC
From: hedley@iit
Message-ID: <122@iit.UUCP>
Source record: 242531

I tried hacking a trap catcher that would catch the output from Timeworks going to the serial port (i.e. Lazywriter), and send this to disk. I got a lot of bombs, sometimes it worked. Basically what you want to do is catch the serial output and input (Lazywriter backchannel info although discarded by TWDTP, is still read), and perform an Fwrite call, I seemed to run into a re-entrancy problem here, you are now one call in the rom via the serial out and you attempt another call this time to the file system.... This all may have been poor coding on my part I was under pressure because UltraScript (the Atari release anyway...) was going out bundled with TWDTP and we had no way to print from it! Anyway, finally after numerous proddings to the UK they (TWDTP) wrote a new .sys file, much better than a crude port catcher since they had the ability to do it cleanly, and I had serious doubts about getting my catcher working bug free. I know that one method is to use RAM and save during a non-critical time but that is a mess too. There must be a way to hack the stack so when you get back to user mode instead of being in TWDTP you are in a small hack routine and then ultimately you return to TWDTP.....

I have heard of a network called Midi-Net available for the ST. Cost is about $150 per terminal, and uses the Midi ports in the back of the machine. I do not know if it conforms to ethernet protocol (it consists of a box with two Midi cables, and what appear to be thin Ethernet coaxial connectors, but I am not sure). The product has only recently appeared in adds (I believe I saw one in STart magazine).

I believe DC Formatter (a shareware product) has an option to write a boot
sector that automatically selects the step rate for drive B. A nifty solution
to your problem. If you cannot locate a copy, email me.

%You get what you need more, I guess.
% Steve J.

Just an offhand question - do either of these cards allow the DMA system
to continue to function if the attached SCSI bus is powered off? My old
Supra card did, but my current one (smoked the old one - oops!) doesn't.
(So if the hard drive is plugged in but turned off, the floppy drive is
no longer usable.)

Does the ICD card support enough of the SCSI command set to plug in
exabyte tape drives or SCSI ethernet boards?

2702. EZ-Ram problems

Newsgroup: comp.sys.atari.st
Date: 1990-03-17 07:25:50 UTC
From: a1532@mindlink.UUCP
Message-ID: <1329@mindlink.UUCP>
Source record: 242532

I've recently upgraded my 520 ST to 2.5 megs with an EZ-RAM board and I've had a few problems. The first 2 megs of memory (from address $0000 to $200000) is fine, but I have problems with the 512 K bank at the end of memory($20000-$27FFFF). When I do word-length or long-length reads from this area, I sometimes get the wrong value back. With byte reads, this almost never happens. Secondly, only the lower half of a word gets munged up on the read. Has anyone else had problems like these and does anyone have a solution?

2703. Malloc() in C and the 40-folder bug

Newsgroup: comp.sys.atari.st
Date: 1990-03-17 07:28:43 UTC
From: jjung@alcor.usc.edu
Message-ID: <8672@chaph.usc.edu>
Source record: 242546

There's been a bit of discussion in this newsgroup recently about how the infamous "40 folder bug" can be induced if too many memory blocks are allocated with Malloc().

I'm currently developing an application for the ST in C that uses dynamic storage of linked lists. As a consequence, I'm Malloc()ing blocks of memory left and right. Since I don't want to encounter this bug, I'd like to know if anyone has a solution for me to use?

Someone posted in this thread that a solution is to Malloc() one large block at the start of the application, then divide it into smaller blocks with malloc() calls. Does anyone have a sample program or actual code to demonstrate this principle? I'm developing with Laser C; the documentation does not specify any problems with using Malloc(), and the entry for malloc() gives me the impression that it is just a UN*X-compatable alias.

Any information will be truly apprciated, either by mail or by a posted reply. Thanks in advance.

John

2704. Re: GEMINI v1.1 (questions)

> I decide to send my registration fee to the author(Fisher if I remember well

Disclaimer: I was never, am not and will never be named 'Fisher'. My name
if Eissing (pronounce it Icing) and I am one of the two authors of Gemini.
I wrote the 'Venus' part of Gemini.

> 1. Has v1.1 solved the problem with the GULAM Shell?
> (v1.0 is not capable of running any other application after 'gulam' has
> been executed once)

Gemini makes heavy use of the system() pointer (shell_p is the official name)
and swipes it using the XBRA protocol. GULAM also installs its own pointer
and overwrites Gemini's pointer. But it doesn't deinstall this pointer
on exit. On exit of GULAM shell_p points to freed memory, Gemini jumps
through this vector and BANG! So, this is an (easy to fix) bug in GULAM.
We can't do anything about it.

> 2. Is an icon-editor included with this new version?

No! Use any standard resource construction set instead to edit GEMINIIC.RSC.

> 3. Is there any option allowing GEMINI to deallocate the memory it uses whe
> another application is launched from the GEMINI desktop(as NeoDesk does)

Not in version 1.1. But the next version will. It's already built in the
version we're hacking on.

2705. Gnu SmallTalk V1.0 port to atariST available

Newsgroup: comp.sys.atari.st
Date: 1990-03-17 12:17:24 UTC
From: bammi@curie.ces.cwru.edu
Message-ID: <BAMMI.90Mar17061724@curie.ces.cwru.edu>
Source record: 242549

GNU SmallTalk V1.0 ported to the atariST is available for
anonymous FTP from dsrgsun.ces.cwru.edu in pub/atari/smalltalk.zoo

requirements:
- a 4Meg atariSt (it will not run on a 2/2.5 Meg machine)
- a decent shell
- optional: tos-gcc V1.37.1 if you want to re-compile it

warning:
- this is the first version of the port, so it probably has
lots of bugs, over and above any bugs in the origonal gnu
code. it does pass all the regression tests with just one
diff.

thanks to the author Steve Byrne for an excellnt job!

here is the (relevant part of) README from the Gnu distribution:

GNU Smalltalk version 1.0 (initial release)
by Steve Byrne

The files in this directory and its subdirectories constitute the complete
source code for GNU Smalltalk. The files are organized as follows:

. The source files, both .st (Smalltalk) and C files
examples Some working example Smalltalk files
test Regression testing files

About GNU Smalltalk

GNU Smalltalk attempts to be a reasonably faithful implementation of
Smalltalk-80 {tm ParcPlace Systems} as described in the "Blue Book", also know
as "Smalltalk-80, the Language and its Implementation", by Adele Goldberg and
David Robson. The syntax that the language accepts and the byte codes that the
virtual machine interprets are exactly as they appear in the Blue Book. Most
of the primitives are the same as well, although due to the differing nature of
the implementation some of the primitives haven't been implemented, and other
new ones have been.

The current implementation has the following features:

* Incremental garbage collector
* Binary image save capability
* C-callout (allows Smalltalk to invoke user-written C code and pass
parameters to it)
* GNU Emacs editing mode
* Highly portable C code implementation
* Optional byte code compilation tracing and byte code execution tracing

* Automatically loaded per-user initialization files

enjoy,

2706. STATUS OF INFO-ATARI16

Newsgroup: comp.sys.atari.st
Date: 1990-03-17 15:02:20 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <900317.09021981.003545@SFA.CP6>
Source record: 242461

It was with great fear that I read how we were to lose INFO-ATARI16 a while back and it is with great joy that the compilations continue to arrive into my account.
With the above in mind, is this going to continue? INFO-ATARI16 provides a much needed service especially for isolated STers living in a sea of Amigas, Macs, and IBMs (my area). The 'heros' of INFO-ATARI16 should be congratulated for maintaining this incredible service.
However, to guard myself against being cut off again from ST information, I'm wondering if there is a BitNet/UseNet gate allowing me access to the daily postings. I have not found anything on our system through our BitNet setup allowing it. A friend in New Mexico is graciously going to forward the daily postings but I wish I could find a way. Any advice sure would be appreciated.

2707. MULTISYNC RECOMENDATIONS

Newsgroup: comp.sys.atari.st
Date: 1990-03-17 15:26:24 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <900317.09262367.003545@SFA.CP6>
Source record: 242462

I know that multisync monitor recommendations are probably becoming
old, I'd like to hit on this a bit more if it is ok.
I've been loaned a Mitsubishi Diamond Scan and would like to note some
disappointments, but only in monochrome mode. There is no shadowing but
the characters are just not sharp enough. Also to keep the proper balance
between brightness/contrast and sharpness, the brightness/contrast ratio
needs to be rather low or one gets a terrible blooming effect and the
characters begin to blur. On the other hand the monitor is far superior
to the Atari RGB monitor in color mode, one can change screen sizes, and
video from a VCR is marvelous.
The Diamond Scan has spoiled me to multisync's though.
Could some brave soul offer a recommendation of a monitor that gives
the best 'power without the price'? Would it be the NEC 3D? My wants are
for me to not lose anything on output quality, either in RGB or monochrome
mode. RGB needs to be crisp and in color just as it is on the Diamond
Scan and monochrome needs to be as sharp as it is on the Atari monochrome
monitors. The NEC 3D has been mentioned. I'd like to know if it meets
the above 'requirements'. If it does not, I'll just keep the Diamond
Scan and get a monochrome unit bringing us up to another recommendation, what
would be recommendations for monochrome? I don't trust the Atari monochrome
boxes anymore (short life span-- 1 1/2 years then flyback dies).
Many thanks for recommendations. If this has been kicked heavily on
the net before, then reply to me directly to avoid wasting of space and time
on the net. Also, I'll be more than happy to sum up and post on the net
recommendations that answer the following:

1. Is the color RGB output as good as the Atari color RGB?
2. Is the monochrome output as good as the Atari monochrome unit's output?
3. What would be recommendations for a monochrome replacement?

Thanks again...

> software? Is it easy to use and flexible (unlike Forem, on both
> accounts).

Michtron has a very slick GEM sysop interface that can function while the BBS is interacting with a caller.

The caller interface is determined by the sysop -- it's very flexible, and the BBS actually interprets a program written in Michtron's own command language. This is both good and bad. It lets you modify it at whim, but it also lets you screw it up. :-)

BBS preferences are like text editor preferences -- often the subject of neoreligious wars. Personally, I'm not a fan of either Michtron or FoReM. I prefer Citadel, which is much easier and faster to use BUT is radically different from most menu-bound BBSes, and therefore confusing to people whose expectations interfere with their perceptions.

The Minnesota Atari ST user group (MAST) runs the ST version of Citadel, as does the Buffalo, NY, user group. The ST version of Citadel is called STadel.

STadel's forte is message networking. There are Citadel systems throughout North America that are interconnected through their own store-and-forward network, plus BIX (the Byte Magazine system). STadel also supports UUCP mail and Usenet newsgroups, such as this one. I used to run a BBS; currently I run a UUCP system and have MAST forward a couple of the Citadel discussions to me in Usenet news format.

STadel is not particularly sysop-configurable -- there are options, but you can't replace the basic (and very sound) structure of the BBS. Users, however, can choose varying user interfaces. And you can install external "door" programs, such as games, questionnaires, bizarre download protocols, etc. (I don't think that is possible with Michtron).

The Citadel model is based on "rooms". Each discussion room also can be made a download room -- you don't have to go to a separate "download area". The rooms are named, not numbered. I think the software supports up to 56 rooms. If you choose to allow them to do so, users can create rooms quite easily. Rooms can be made private and any list of users can be invited into any private room.

STadel has one more advantage: It's shareware, which means you can try it for free and pay only if/when you can figure out where the author lives this month. :-)

The MAST BBS can be contacted at 612-472-6582; the BRASS BBS is 716-692-3843. I think both are "closed" systems; after you connect, type "M" for mail and "E" for enter, then leave a msg for the sysop including your name and a password.

I NEED HELP!!!!!!!!!!!!!!!

I am half way throught CSB and I am stuck!!!

I have completed NETA (priest) and KU (fighter) but I am stuck at the demon director. To go along the DAIN (magic user) path I must have a key to get through the door, I HAVE TWO CHESTS OF KEYS AND NONE WORK!!! To continue along the ROS (ninja) path I must go down a section of the demon director that is blocked by pit (over in the back left corner) I noticed that it has a teleporter behind it because when I throw things down the hall they keep bouncing back and forth for a bit then disappear.

I know that a discussion went around about CSB about 3 months ago but i didn't read it 'cause I didn't have it yet and I didn't want to cheat (yet).

Please help...........

When I upgraded from the BMS-100 to the 200, Vance warned me that I'd no
longer be able to boot my ST with the power to the drive turned off. If
you need that ability, I think the BMS-100 boards are still available.
Alternatively, Vance may have mumbled something about the possibility of
adding some expensive fast line drivers if I was into hardware projects
(I don't need to boot my ST with the drive off but connected, and I'm not
into hardware projects, so I wasn't paying attention).

According to an Atari Customer Service Rep, Barbara Bentson, this is not true. In January I sent my Mega 2 in for service, and I am now typing on a brand new Mega 2, just off the boat from Tiawan (almost literally). Incidentally, even though Atari USA had a difficult time getting a replacement for me in good time, they were very nice, handled the situation well, did all they could, and when they finally got the new machines in stock they sent it to me by overnight mail. Although faster service would have been nice, it's refreshing to see that the people behind the service are as helpful as seemed humanly possible.

> and just preceed any packet with the number.

I have quite a bit of this done for the ST, in GFA (haven't had time to translate to assembly). It sets up a network of machines using MIDI and serial ports (not modems yet, give me a chance). It uses any topology which could be decomposed into a ring, although it routes messages intelligently. So far it has worked well on a small network of 2STs and one Amiga (set-up anyway, GFA for the Amiga doesn't support INP?(), which is stupid, since the system calls exist, adn I haven't had time to figure out how to do the calls frome GFA). However, (Atari's lack of documentation flame deleted), I haven't got it set up to run asynchornously with applications. This means that occasional calls to do_net are required. Incidentally, if anyone knows how to hook up such an asynchronous routine like this, please write. I can't seem to find where things like interrupts are (except for the retrace queue, and I don't really want to muck with that in this case). If you want my network stuff, email.

> -dav

Thanks for the remark, I will be careful using f2c.

Meanwhile I brought it up. It required mainly a bit of hacking file
names, thanks to the decent gcc system. To test it, I built an Erlgraph
metafile interpreter with it (on our unix box) and it worked. The
Erlgraph (commercial graphics system) code is not very efficient but
rather clean ...

It will be posted soon.

Source record: 242459

I also love Gemini. I also love MT C-Shell, because it lets me use foreach, etc constructs. Why does Mupfel imitate the Bourne shell instead of CShell? Surely no one prefers Bourne shell, except for picking apart shell archives (which Mupfel doesn't do anyway)? Still, excellent work. I think that Gemini takes another step towards bridging the gap between friendly graphic shells and actually useful line-oriented shells.

2717. Re: RTX programs

Newsgroup: comp.sys.atari.st
Date: 1990-03-18 01:06:00 UTC
From: david.megginson@canremote.uucp
Message-ID: <90031801522007@masnet.uucp>
Source record: 242460

It would be useful for all of us to know what RTX programs are currently under development. Is anyone developing a command-line shell which uses RTX? Any graphic programs? What about text editors which use Popen to pass the text buffer through filter programs like sort or tr?

On the same note, have the Gemini (word included so that this message will pop up on their mail readers) authors considered integrating RTX and Gemini? What a concept!

I love MT-CShell and VSH, but I'm always looking for new things to waste my time learning.

2718. ETHERNET cards on the ST ? Still awaiting information.

Newsgroup: comp.sys.atari.st
Date: 1990-03-18 01:18:00 UTC
From: kruel@vax.rz.uni-wuerzburg.dbp.de
Message-ID: <103
Source record: 242465

Dear networkers,

A few days ago I asked about the availability of ETHERNET cards
for the ST. Up to now there is lot of interest, but little
information.

Besides the fact, that somehow one could port IBM-software for
solutions, where PC-cards are hooked up through SCSI- or VME-
controllers, I've not yet heard about a "hop-down-to-
Computerland-and-buy-one" product.

Phoning some German companies gave same more informations.
Rhotron has a server-based Ethernet connection (expensive),
Biodata is rumored to have something equivalent, GTI is said to
work on it.

I will be on CeBit in Hannover on March 26/27. After then
you'll probably get more informations from me.

Greetings,
Thomas-Martin Kruel.

2719. GRAPHICS TABLET for the ST

Newsgroup: comp.sys.atari.st
Date: 1990-03-18 01:21:00 UTC
From: kruel@vax.rz.uni-wuerzburg.dbp.de
Message-ID: <104
Source record: 242466

In a previous article on this group, Mr. John Schmitt
<johns@maccs.dcss.mcmaster.ca> has asked for graphics tablets for
the ST.

We have got one in our department, here is some information:

- Name: SummaSketch Plus

- Manufacturer and vendor:
Summagraphics Corporation
777 State Street Extension,
Fairfield, CT 06430, U.S.A.
Phone (in the U.S.): 203-384-1344

- Features:
- work area approx. 12" x 12"
- four-button mouse
- two-button stylus
- resolution is 1000 lines per inch
- works through a mouse emulator
- both PC and ST-versions exist
- input cable for the ST is hooked between keyboard cable
and ST
- power supply is external

- Package includes an installation program (defining your
work area mainly) and a driver, announcing the device
(don't know what is does exactly).
- documentation is very, very poor (no manual at all).
- 2 years warranty

- Price: approx. 2000.- DM (here in Germany).

A colleague of mine works with it, doing the programming in
GFA-Basic. We digitize old, dusty recorded curves with it. Works
quite satisfactory.

If anybody needs more info, please email directly.

Thomas-Martin Kruel.

Why do you feel that CPU Report is an:

extremely poor quality "column". If you distributed it to the newsgroups that it theoretically belongs in, you'd be laughed off of Usenet. That's just my opinion.

(Greg Lindahl's words quoted above)

And what are your suggestions to make CPU Report at least palatable to you, anything else?

I would truly appreciate any comments, "constructive criticism", or suggestions that you may have for making CPU Report a better column, as compcomplaints usually have some basis...

You can get blitz.tar from the ~ftp/atari/new directory on terminatoor,
until it gets moved to its proper place (diskutils, most likely). This
file has software and text docs.

From: Peter_Lawrence_Jackson@MTSG.UBC.CA
Message-ID: <2129564@mtsg.ubc.ca>
Source record: 242456

I'm having some trouble getting hardcopy charts from the opus spreadsheet
program. I vaguely recall reading some comments about quirkiness with
opus and ASSIGN.SYS, which sounds like my problem. Charts appear fine
on the screen, but when I try and print them out from opus directly,
I get "Incorrect Printer Driver", when I try and print out a .geo file
using outprint.prg, I get "The metafile doesn't match the printer for which
it was prepared". As far as I can tell, things are set up correctly: I have
fx80.sys where ASSIGN.SYS says it is, etc. I also notice that when I try
and input a .gem file saved from opus into easydraw 2.?, things get
screwed up: the labels are partly ok, but axes and plots are missing.
I'm using opus v2.0. Any help would be greatly appreciated, either
to me directly, or to the net if you feel it isn't a waste of bandwidth.

2727. Current Notes Thanks Rob DeMillo

Newsgroup: comp.sys.atari.st
Date: 1990-03-18 14:23:00 UTC
From: JOHNBARNES@ENH.NIST.GOV
Message-ID: <9003190801.AA01902@ucbvax.Berkeley.EDU>
Source record: 242486

About Current Notes magazine
About Current Notes magazine

The staff of Current Notes would like to thank Rob DeMillo for his nice testimonial. As one of the staffers (I author a monthly column called "The Junkyard Pussycat") I would like to help correct a few misimpressions that may be floating around. First of all, Current Notes is not published by a consortium of user groups. Current Notes Inc. is an independent entity that tries, first of all, to pay all of its bills and then, if possible, to make a little money.
Unfortunately its honesty sometimes get in the way of a pure pursuit of the profit motive because news sources know that they will be quoted accurately, and developers know that the shortcomings in their products will get detailed scrutiny. The columnists, editors, and reporters are, however, talented people whose output has earned the magazine a good measure of credibility in the Atari market.
CN's writers are not paid. The ability to get something off one's chest every once in a while or to help someone who is floundering seems to be reward enough. The writers are all part-timers with other full-time jobs that give them plenty of things to do. Many of them are employed by the Federal Government and have a strong commitment to public service, hence the emphasis on trying to help ordinary Atari users.
There is a sort of symbiotic relationship with the Washington Area Atari Computer Enthusiasts (WAACE) with which several of the more prominent staffers are associated. This is, indeed, a consortium of user groups in metropolitan Washington DC, Baltimore, and Richmond.
WAACE's main activity is sponsoring the Washington DC AtariFest, about which we will have more later.
CN does not look as slick as some of the national Atari magazines. But, as CN starts its 10th year of existence, it is still operating in the black and its main quality is found in its content. In order to provide a glossier appearance, we would have to increase circulation well above the current level of around 4,000 and then expand to a larger, full-time staff to handle the increased complexity of production and increased circulation. At the present time, the final layout work can be done by a single individual using Atari computers and the SLM804 laser printer.
The honesty that Rob DeMillo finds so engaging can also be an obstacle. Some dealers are reluctant to carry a magazine that might suggest all is not well in the Atari world (potential customers can be scared off!) Some readers have written in complaining bitterly about their inability to buy equipment, software, or service, and then, in the next paragraph, chastise CN for not providing a more upbeat view of the Atari world. Advertisers can also find our candor disconcerting and may

react negatively if their products do not receiving glowing reviews from our authors.
The Current Notes software library is a leading source of well-characterized programs and graphics. It currently contains about 440 ST disks and over 50 Spectre disks. The first 350 or so ST disks in this library are available on CD-ROM for a price of $70. It is thought to be the only Atari product currently available for the Atari CD-ROM drive. The TeX distribution (disks #395-#399) is the best source of this material for a TeX neophyte. A lot of work goes into keeping this library up to date and useful.
Current Notes also lists the stores that carry the magazine several times a year as a means of pointing people to real Atari dealers. There is also a special program for reduced rate subscriptions to user groups and participating groups are listed in every issue as a means of introducing Atarians to local user groups. The magazine pages devoted to the WAACE groups also provide some insight into the state of user group activity in at least one section of the country.
Current Notes can be reached at 122 N. Johnson Rd, Sterling, VA 22170. Phone: 703-450-4761. Their GEnie address is JOE.WATERS. They now accept VISA and Mastercard in payment for subscriptions and disk orders.
Thank you for your attention and I hope that this public service announcement will be found to be within the bounds of proper Net dialog.

Could someone give a short description of the parameters to Rwabs? All
the ones I've seen say something like the device number is:
0 Floppy A:
1 Floppy B:
2+ Hard disks/networks etc
So, if I wanted to read some sector on drive D:, what would I give?

Thanks!

Chris

>if anyone has a solution for me to use?

I believe Laser C's malloc() does the "right thing"; you can easily
test it by simply malloc()ing several thousand little blocks and see
what happens. If you want to see source for malloc() that does the
right thing, ftp the source code for dLibs from terminator.cc.umich.edu.
dLibs is a complete library, and also contains nice things such as
the new ANSI str* functions.

Message-ID: <900318.18241755.003982@SFA.CP6>
Source record: 242490

Hello all,

I tried to send the following to George Woodside, but it, as you've read before, "bounced". sigh

Hello George,

I would bet that if you wrote a port of Turtle for the GCR and offered it for sell commerically that you'd have a winner. I have tried every commerical and shareware harddrive backup utility for the Macintosh but these just won't work on the GCR.
Anyway to persuade you to convert Turtle for the Mac so that ST GCR folks would have a decent backup utility for their hard drive? Since Spectre GCR typically out performs the Mac on the hard drive, it is a shame that we don't have a good hard drive backup utility. Yes, I know that Dave's MegaMinute Elite does indeed work, but it is for image backup only and you risk losing files if you get the 'slow write' error. I WANT TURTLE GCR!!! Also, I know that it is better to back up the files using the SysQuest mechanisms and cartridges, but not all of us can afford such a wonderful setup.
I just want a nice, dependable hard drive to floppy backup utility for my GCR that WORKS! I WANT TURTLE GCR!!! It would be sooo nice.
I read on the Mac net that DiskFit was tried but would not work.
So, George, among all your other projects, could you possibly consider porting Turtle to the GCR??????

I am now the proud owner of a hard disk (5 years of floppies - ah well, I used casette tapes on a CoCo before that!). I have a program called CONTENTS which produces a complete directory of all files (within folders, within... like Un*x's ls -lR), but there's a few things I don't like about it. Could someone eMail me a pointer (mail server address, or FTP site) for such a program, perferably with C source? Also a "WHEREIS" utility would be a nice companion, or I could grep the complete listing, I guess (OK, having thought of that, where's a good GREP? ;-)

On another note:
Could someone who has used both Turtle and Vault comment on their pro's and con's? Perferably someone who's done both backup & restore.
The latest turtle is version 2.14? If not, where is it archived?

Please reply to me direct, I'll summarize...

I'm somewhat interested in this topic, since I plan to be picking up a few more STs soon and don't want to give up any functionality by splitting up my two Atari monitors just yet. But just a side comment; Larry Rymal mentioned Atari monochrome monitors dying after 1-1/2 years. I've had mine since summer '87, and it's been working fine for a long time, with many periods of extensive use, merciless tweaking (}-)), etc...

But, I'm still interested in having all 3 resolutions available on one monitor, provided I don't lose the clarity I've gotten used to on the monochrome. So please, someone, post a summary, eh?

// / // /// // // O N L I N E
////// // // /////// //
```

The Weekly ATARI NEWS FIRST Online Magazine!
==========
March 16, 1990:

ATARI CORPORTATION LAID OFF 15% of ALL U.S. EMPLOYEES,
EFFECTIVE AT 5PM PACIFIC TIME TODAY.

This cutback and layoff is NOT a temporary measure for those who received their termination notice at the close of business today in the Sunnyvale, California offices of Atari. No expectation of callbacks in the foreseeable future was extended to the employees.

The layoffs occurred at the service level of all departments, but particularly hard hit were Accounts Payable and Credit, losing 50% or more of their staff.

Of the "Name" people that most of the public has any contact with, there were no terminations. Popular figures such as Bob Brodie, Charles Cherry, and others were not directly affected. Additionally, no changes at the executive level were made public.

Conjecture by those near ATARI is that the cutbacks are due to the fact that Atari simply has no product ready for immediate sale, and that the bulk of those laid off had little to do that is essential to the current level of U.S. Operations. The fact that the upper level employees were spared gives some reason to expect that this is not a long-term reduction in overall operation, but more an immediate action for an immediate situation.

CEO of Atari, Sam Trameil, was unavailable for comment or for employee negotiation today, having left the USA for computer shows in Europe earlier in the week.

Z*NET will have more on this story as it develops this week...
look for details in the next Z*NET ONLINE MAGAZINE, issue #513,
available starting Friday, March 23, 1990. And, as usual, Z*NET
will bring you ATARI NEWS FIRST.

2738. Hard Drive

Newsgroup: comp.sys.atari.st
Date: 1990-03-19 04:04:00 UTC
From: FRACHEL@UMIAMI.MIAMI.EDU
Message-ID: <9003190803.AA02065@ucbvax.Berkeley.EDU>
Source record: 242491

Ok, I've been away for a while and need some info:

My Predicament:

I want to build a hard drive system for my St. Basically I need to buy a
host adapter, a controller card, case, power supply, and hard drive.

I will most likely get a seagate hard drive, and the Icd host adapter.

Now i have also seen from Icd the host adapter + controller kit (either
MFM or RLL).. Now I really have no idea what MFM or RLL means, so If i
buy a seagate hard drive, (Probably something like a 296N (i think thats it)
which kit should i buy, the RLL or the MFM?

Please reply in email.

Thanks for any help.

Yup. I am using one now.

Navarone makes a cartridge clock called (cleverly) The Timekeeper.
Calling any ST mail order house should get you one.

I think they are around $40...its been a few years since I
got mine...

2740. Help on Mega 4

Newsgroup: comp.sys.atari.st
Date: 1990-03-19 05:00:12 UTC
From: SYTANG@CSUGREEN.BITNET
Message-ID: <900318215638EC1.JVMR@CSUGREEN.UCC.COLOSTATE.EDU>
Source record: 242492

Hello STer:
A local user group member has question about Mega 4:
HELP!!!
1.
I have been having numerous problems with my MEGAs since day one. Can anyone help me out? I currently upgraded to a MEGA ST4 and am still having to reset the time each time I turn the machine on to get correct date/timing of my files. I have double check my batteries with an ohm meter and confirmed good contact with the terminals - I can't figure it out.

The other problem is program inconsistancy. When I call up Partner ST from TimeWorks It covers the top menu bar with a checkered Partner ST bar. When I quit Partner, the Partner Menu bar is still at the top, no selections are listed though the drop down menus still work if I go up there. I can get rid of it by activating another program that boots with a program title bar - and then everything is fine. Again, I can't figure it out.

Any suggestions?

Tim
2.
I've been using YardRam for over four years and it works great!!! The operatio of the program is simple. YARD800G.PRG just needs to be renamed as YARD400F.PRG for a 400K RamDisk as F Drive, the previous .prg would be a 800K RamDisk as G Drive. As I said the program is great flexible and once installed as a floppy drive the RamDisk is always there. The only situation I have had a problem with has been with my new MEGA ST4. My 1040 and MEGA ST2 ran fine but the MEGA ST4 has a different memory setup and will not recongnize the RamDisk. Can anybody help me with this?

Please help, I'll transfer the information to local user group BBS as they come in. Thanks in advance for any informations that you can provide.

>Has anyone else had problems like these and does anyone have a solution?

Did you connect the extra power leads that are attached to the board to
the power supply?

At first, I blew this off and figured the bus could provide enough power
(WRONGO!) for the extra RAM, but you will get flaky results without them
connected. I used to get intermittent errors until I connected the
buggers. Hope this helps.

Yeah, Atari is hurting. Honest, I'll find the time to post the
credit analysis of Atari Corp. They are in deep yogurt.

Since 16mhz 68030's are a dime a dozen now, maybe Atari should
consider a beefier TT (you know, that machine that has been due
REAL SOON NOW for almost a year..hehe).

Hope Atari gets their house in order. It is getting depressing watching
all our US hi-tech companies fold. sigh...

Source record: 242494

I expected to be done with the port of umoria to the ST using Mark Williams C by now. There'll be a delay, due to a nasty bug which causes only delayed symptoms. Jim Wilson hasn't released the score file management part of the unified code anyway. The executable will be posted as soon as it's ready. There's a decent chance that someone who is handy with GNU C and its debugger might get it working right first (but I doubt it).

>are as helpful as seemed humanly possible.

I wonder how many of those "helpful people" were among those fired last Friday..?

Atari Corp. seems to have found entirely new ways of looking at "doing business"... (anyone looking for a subject for a collegiate thesis..? Atari could provide a rich resource for "unusual" ways of doing business)

It used to be "Why should we Advertise, when we don't have the product to fill the demand advertising would generate"... now, it seems to be, "Why should we employ people in Accounts Receivable when we don't have any Accounts to Receive...?

Taken to its extreme, with no product to sell, and no people in its offices on a payroll, Atari Corp could serve as a model for corporations of the future... just Jack and Sam, and Lenny and Garry... sitting around an oak table, deciding which products NOT to ship this month... and raking in the $$$$...

BobR

(In case you missed the Z-Rag report, Atari Corp has fired 15% of its US work force as of 5PM last Friday... gives you a nice, warm, secure feeling doesn't it...?)

> if anyone has a solution for me to use?
> I'm developing with Laser C.

You don't have to worry at all. Simply avoid using Malloc and
use malloc all the time. Laser C will allocate a large memory
chunk with Malloc whenever neccessary and pass it on to you in
(smaller) chunks you request with malloc.

2748. Writing text to an offscreen bitmap

Newsgroup: comp.sys.atari.st
Date: 1990-03-19 07:52:39 UTC
From: pa2027@sdcc13.ucsd.edu
Message-ID: <9206@sdcc6.ucsd.edu>
Source record: 242485

I'm double-buffering using the phys & logical base stuff successfully, but I need to write some vg_text to the offscreen bitmap. It appears to only write to the screen being shown, which shows the annoying re-draw and flicker that I'm trying to avoid by using double-buffering. Could someone e-mail some sample C code or an explanation as to how to do this... should I use vg_text or some Line A stuff or what?

thanks in advance,
Brad

2751. FOLDER 40 bug - New TOS 1.4/1.6 Memory Management Problems

Newsgroup: comp.sys.atari.st
Date: 1990-03-19 11:40:29 UTC
From: U0179@DGOGWDG5.BITNET
Message-ID: <9003200806.AA28240@ucbvax.Berkeley.EDU>
Source record: 242475

Hello 'Netters',

Because of the second 'offical' Patch for the TOS 1.4 version I have
investigated some time to analyse the new/old problems with the memory
management routines within the new TOS releases.

The so called '40 folder bug' is really fixed but...:

...there are some NEW errors/problems within these routines!

The biggest one was the totaly wrong code for the 'post garbage collection' of
memory descriptors (Allan Pratt fix this with 'poolfix3' patch).

Some background information:

In the new version of TOS (1.4,1.6,x.x?) the handling of the system internal
memory (pool) has completly changed. Now there can be up to four memory
descriptors (MDs) placed within one pool block. Those special pool blocks
are not more available for other purposes like folder descriptions etc.
until all four MD's within this MD container are released (I have named those
special pool blocks 'MD container').

A MD is need by GEMDOS to describe the usage (allocated,free), location, size
and ownership of (user) memory chunks.
MD's are registered (with regard of there usage state) in two memory management
lists (the ALLOCATED and the FREE list). The roots of these lists are registered
within a structure called 'memory parameter block'(MPB). In this MPB is a third
information located, the ROVING pointer. This pointer is used to avoid the
concentration of small blocks at the front of the memory space after repeatedly
using of allocation/free user memory. For more information of the theorie of
memory management implementation see: Donald E. Knuth, The Art of Computer
Programming, Volume 1, Chapter 2.5 with exercise 6 (First fit method with a
roving ptr). A MD becomes unused if two free (user) memory chunks (with its
own MD's) are consecutive so that its memory could be described by one common
MD.

After some alloc/free operations there could be some MD containers exist, wich
contains one,two,three or four placeholders for unused MD's.

Assumed,
at any time, one will open a new file, this needs at least one WHOLE pool block,
but there are only some (partionally) filled MD containers available, what
could we do ? Right, we could try to compact MD containers so that we get
one pool block with four unused MD's.

.. and this should be done by the erronous implemented routine. Some
errors of this routine are:

a) the implemented algorithms locks itself to find MD container
with unused MD's with a smaller unused count as at there first hit,
b) if they found only one MD container with unused MD's in it, they
treat the next pool block (REGARDLESS of its usage eg. file,folder
etc. descriptor!!) as MD container and destroyes its contents,
c) after moving MD's between MD container they forgot to update the
roving pointer, so that this pointer will point into the desert.

THIS IS A NEW ERROR OF TOS 1.4/1.6 AND HAVE NOTHING TO DO WITH THE OLD KNOWN 40
FOLDER PROBLEM.

The usage of Allans POOLFIX3 patch it strongly recomended! By the way, Allan,
your patch should save all registers like the ROM GEMDOS handler do it.

If somewhat is interested in the replacement (within (ep)rom) code, please let
me know. I think, I could publishing this code here without problems because
I am using a totaly different algorithms. Any comments, ATARI?

Now the other errors/problems (not complete!) I have found through the journey
of the TOS 1.4 memory management :
- mshrink: call of mshrink with newsize=0, the MD of this memory
space will be released within pool but forgotten to be unlinked from
allocated list.
- ptermres: the information of the memory allocated by this process
will be released from the allocated chain but not within pool.
- the message: *** OUT OF INTERNAL MEMORY also displayed, if the
memory management encounters errors within pool management, then
the usage of FOLDRxxx is not the right way to correct this problem.
- some 'dead code' within routines wich never be reached.
- some 'optimizing' modifications made by atari forces that the new
code really becomes 'un-optimized'.
(In german: der Schuss ging nach hinter los - I do not know the
english equivalent, sorry). In some routines they change register
usage against 'in-direct' access of routine parameters, this will
be one processor cmd less, but on the other side each reference
of a parameter will we longer (size&time)! See malloc, pool
allocation code and so on.
- malloc: there is no need to look for the largest memory block
available if we use this function for really allocating memory.
- malloc: if you got via malloc(..-1..) the information, that there
is stil memory available, for example 500000 bytes, and you request
400000 bytes of it, you should get it (I mean). This needs one
additional MD for the remaining memory space. If the pool is full,
GEMDOS gives you NO memory in this situation! Why? I think, GEMDOS
should give at this point the totaly remaining memory to the user.
If the user request more after this, the information call of
malloc(..-1..) should return zero and the allocation request also
fails.

To correct all these problems one have to publish the total memory management
code. If I do it here, (I assume) I get problems with ATARI's copyrights.

Date: 1990-03-19 18:26:09 UTC
From: apratt@atari.UUCP
Message-ID: <2074@atari.UUCP>
Source record: 242496

OK, kids, here's the scoop: I don't know anything, I only report what I think is true. I'm a real person behind the glass screen you see, and I can be wrong or misinformed.

Don't blame the messenger: if you don't like Atari's policy, say so, but don't say it in such a way as to blame me. Also, it won't help much to say it on Usenet. Write to Sam T. if you want to be heard.

As it happens, I *am* misinformed about the RAM situation, and I'm REALLY sorry I got in the middle of this. It turns out that a policy decision was made a while ago to the effect that SIMMs (the socketed kind) are to be used when building STe's. I don't know if any were built before that decision, and whether SIPs were used in them. As has been pointed out, using SIMMs makes a machine upgradable without solder. It does NOT make them user-upgradable, at least not in the USA, where opening the shield (or maybe the case) voids your warranty. Furthermore, policy decisions are subject to revision by future policy, so I still maintain it's a bad idea to assume that an STe has SIMMs rather than SIPs.

Finally, a side note: using SIMMs is not all rosy. The advantages of (dealer-)upgradability must be balanced against the disadvantages inherent in socketed SIMMs. They're less reliable: the sockets break, the contacts get dirty, the SIMMs come loose, etc. So your upgradable STe is less reliable than it would have been with soldered-in SIPs, along with being more expensive because socket+SIMM usually costs more than a SIP alone (I think). Lower reliability also translates into higher production costs because it lowers the yield in manufacturing, making the cost-per-shippable-unit higher.

Remember, what I say here is *not* "The Voice of Atari" and in fact what ANYBODY says is to be interpreted in the context of what that person knows to be true, or has "heard" is true, and how likely it is that the person would have heard if the policy changed. I am *not* likely to be up-to-date on policy in manufacturing, because it's FAR from my concern, and I pass things along only to be helpful, not to be official.

My disclaimer: Read it. Live it. Be it.

2758. SIMMs/SIPPs in the STE

Newsgroup: comp.sys.atari.st
Date: 1990-03-19 18:57:10 UTC
From: kjetilho@ifi.uio.no
Message-ID: <2754@ifi.uio.no>
Source record: 242499

I just read in the English mag Popular Computing Weekly
that Atari has problems getting a licence for their STE's
from the American RFC (Radio Frequency Control?)

Apparantly the SIMM-sockets output too much radio noise,
or something like that... It seems to me that SIMMs
could cost Atari Corp. quite a lot more than the <$1
claimed here at the net!

This might explain why SIMMs are promised in European STEs,
while Atari US are very careful not to promise anything...

I have a simular problem. I have CAD 3D 1.0 (should I get 2.0?) and
the printer/plotter drivers. I would like to convert my CAD 3D files
to HPGL. The plotter drivers do this (by definition) but will not
save the converted stuff to a file. I called Antic and found out they
only answer technical questions on Monday and Friday between 9 and 12.
I actually got through today and the guy who answered the phone couldn't
tell me how to do it. I did get him to promise to suggest this feature
to the author though.

So, meanwhile, does anyone know how to do this? Is there a hacked version
of barrel that captures the parallel port?

>commerical and shareware harddrive backup utility for the Macintosh but
>these just won't work on the GCR.

That'd be kinda hard. The Mac's file system is totally different from the ST's.
Besides, I just backed up and restored my hard drive with DiskFit 1.4 (1.5
should get here tomorrow; ordered it from Mac Zone 1-800-248-0800 for $61 total)
It isn't quite as fast as Turtle (and, quite frankly, it wouldn't work on my
Mega 2 - what else is new? - because it kept turning my HFS disks into MFS ones)
but it does work.

[more stuff deleted]

Don't get me wrong; I would love a Turtle GCR too, but it won't be the same
Turtle we all know and love due to major differences. Unless of course Mr.
Woodside pulls off another miracle.

I understand that Megamax/Application Systems offers a Modula 2 package for the ST. If the company supports the package as well as it has its C compiler (Laser C), I'd call it a good deal among commercial offerings.

2765. Atari/Notator/DX7 help needed!

Newsgroup: comp.sys.atari.st
Date: 1990-03-20 00:00:25 UTC
From: gdr@PacBell.COM
Message-ID: <34532@pbhya.PacBell.COM>
Source record: 242361
Cross-posted to: comp.music,comp.sys.atari.st,rec.music.makers

Is there anyone else out there running Notator/Creator on an Atari ST
with a DX-7?

I'm trying to get started with it but the manual is less than clear.
The problem seems to be that it is not recording data from the DX.
I've checked the cables and set some options in the MIDI menu, to no
avail.

I also have some other basic questions that just don't seem to be covered
in the manual, like how to play a piece you've put together on the
note-editing screen. Please respond via email.

2766. FOR SALE: 1040STf

Newsgroup: comp.sys.atari.st
Date: 1990-03-20 00:30:00 UTC
From: EDGINGTC@Wabash.BITNET
Message-ID: <9003210802.AA11268@ucbvax.Berkeley.EDU>
Source record: 242352

I tried this before but had no luck, so I'll try again.

I have the following for sale:

1040STf computer, excellent condition.
SM124 Monochrome monitor, excellent condition.
Commodore 1702 Composite monitor.
Video Key, RGB to Composite converter.
- The video key and composite monitor provide an
excellent substitue for the SC1124 color monitor,
providing quality low-res color output at virtually
half the cost of the atari monitor
- the video key also allows you to record your computer
games, animations, or whatever you want, on most VCR's
as long as the VCR has composite input
- the monitor can be used as a television if your VCR
has composite output
Mouse with new, extra long, super flex cable.
Joystick

All for $900 (I might go for $850).

I also have ALOT of software for this system, if you are interested in
the software, send me a message.

Thanks,

****

2769. Atari's blitter vs. the Mac RISC graphics unit

Newsgroup: comp.sys.atari.st
Date: 1990-03-20 03:33:31 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <900319.21333002.006066@SFA.CP6>
Source record: 242374

Hello all,

This is not a direct quote since I'm doing this from memory but the
March 19th Dallas Morning News announced that Apple announced a RISC
graphics chip that is supposed to make windows, circles, text, etc.
draw up to 30 times faster than a 'standard Mac' whatever that is. The
same article stated that the Mac's RISC unit 'is the first chip of this
nature' on the market or something to that effect.
The ballyhoo was so intense in the article that the reader would
really think that this was indeed a 'first'.
Now I'm just a dumb 'Joe End User' but what about the blitter chips
for the Atari ST and Commodore Amiga? The article also continued with
phraseology similar to that of the ST and Amiga in that it said that the
main CPU could now get on with traffic managing tasks rather than the
actual graphics management. Still sounds like a blitter to me. If this
is indeed a first then WHAT ABOUT the ST and Amiga chips? I mean, seriously!!?

Source record: 242369

The operators of the Terminator archive have graciously agreed
to post information submitted by Current Notes Magazine in a special
subdirectory. The first posting is an ARCed file that contains
tables of contents for selected issues, a list of user groups, a list
of Atari dealers who carry the magazine (this is perhaps as good a
list of U.S. Atari dealers as there is), the complete catalog of Current
Notes PD disks, and other information.

Additional postings will follow soon. Announcements of such
postings will be placed on the Net when they occur.

The file that has been posted is named CNFACTS1.ARC and it is in
the /atari/magazine/curnotes directory.

Thank you for your attention.

Source record: 242370

<headlin2>For Immediate Release
<headline>WAACE AtariFest '90

The Washington Area Atari Computer Enthusiasts will hold WAACE AtariFest 1990 on October 6 and 7 1990. This event will be the premier East Coast event for people who are interested in software and hardware for Atari computers. The show will be staged at the Sheraton Reston Hotel in Reston, VA. Show hours will be from 10 am to 7 pm on both days. In addition to the shopping bargains available from over thirty vendors there will be a full round of demonstrations, tutorials, and seminars. A banquet on Saturday evening will feature a special speaker on Atari matters and Current Notes Magazine's "Author of the Year" award. Special mixers will cap off the evening's festivities. Approximately 3000 visitors from all over the USA, Canada, and other foreign countries attended the 1989 edition of the show.
Admission charges are $5 for one day, with a 2-day pass available at $7. A discount rate is available for ticket purchases by user groups. Children under 12 will be admitted free.

The Sheraton Reston Hotel is a spacious, attractive facility located in a parklike setting near Washington, DC. The hotel is offering a special room rate of $59 per night plus tax to Fest goers who reserve by August 6th. The hotel room rate includes 2-day passes to the show for room occupants.

The WAACE show has established itself as the premier Atari event for East Coast Atari fans. Bob Brodie, Atari Corporation's, goodwill ambassador, has labelled the WAACE show as one of the two "must see" events for Atarians held in the USA.

> Just a few questions:
> 1) How can i print a file on my printer when i'm in GEMINI?
In think we are speaking of version 1.0. You can type
'cat filename >prn:' in MUPFEL or you can make a batch file 'print.mup'
which does the job.

> 2) Is it possible to start a program with one keystroke in
> GEMINI (ie ESC SHIFT C for Calamus)?
No, in future versions there will be shortcuts for programs, but in the
available versions there is no possibility.

> 3) If i start a program which uses lots of memory it wont
> run when started from GEMINI, is there a fix?
Yes, the version we're developing at the moment can start programs
via shel_write, so Gemini can free all memory.

2777. fastload (null filling the BBS)

Newsgroup: comp.sys.atari.st
Date: 1990-03-20 10:28:24 UTC
From: hans@duttnph.tudelft.nl
Message-ID: <1190@dutrun.UUCP>
Source record: 242378

I found a file called fastload.st on the ruu.nl server, which should make program startup faster. Instead of filling all remaining ram with zeroes, it only cleared the BBS section. Author was Leo de Wit, in 1988. As I seem to recall, there was some discussion whether this was allowed. Furthermore, the file only contained assembler source, and I find myself without a proper assembler. So there are two questions:

1) Is this allowed ? I recently upgraded my ST to 2.5 Megs and would like to speed things up.

2) Does anybody have a binary ? I can send the source if necessary.

Thanks in advance,

Hans

2778. gdos / metafiles problem

Newsgroup: comp.sys.atari.st
Date: 1990-03-20 10:48:57 UTC
From: zessel@tsetse.informatik.uni-kl.de
Message-ID: <3896@incas.informatik.uni-kl.de>
Source record: 242363

Hi netlanders !
I develop a program that writes metafiles.

What is necessary to opnwk(Metafile) ?
The problem:
My code always bombed with a buserror and a gemfile.gem 68 bytes long
until I noticed that every example program in every gem book I know of
made an opnvwk on screen before. I did that to too and it ran.
Furthermore I found out that the virtual workstation doesn't need to be
open while writing metafiles, it has to be opened once and may be closed
directly afterwards.

I conclude that this may have something to do with gdos loading drivers
and fonts etc. or at least some sideeffects inside gdos.

Did anybody else see this ?

I can turn off the power switch on my ICD FA*ST drive and then boot the
Mega ST2 from the floppy. Several times I have installed accessories
on the C drive and/or programs in C:\AUTO that did not get along with
things I already had there. One recent problem was infinite looping.
It was easy to solve the problem... Turn off the HD, re-boot from any
suitable floppy, (even a blank one), pop in the ICD boot disk, then
install the C: icon. At that stage I could remove the offending
accessory or program.

>Does the ICD card support enough of the SCSI command set to plug in
>exabyte tape drives or SCSI ethernet boards?

Dunno. I hope yes.

2781. TIMEWORKS AND POSTSCRIPT FILE OUTPUT

Newsgroup: comp.sys.atari.st
Date: 1990-03-20 13:10:19 UTC
From: CHIASSA@UDEM.BITNET
Message-ID: <ID0952.D900320.T091019.CHIASSA@UDEM>
Source record: 242364

Version 1.12 of TIMEWORKS DTP can save files in POSTSCRIPT format. Although I don't have a postscript printer I installed TIMEWORKS DTP as if I did. When you click on print it asks if the destination is disk or postscript printer. I did a sample file and intend to take it to a friend with a postscript printer to check the end result. I obtained version 1.12 last October.

->out and buy a 520STe expecting to be able to upgrade it.

At least in Germany easy expandability to 4 MB is an
advertised feature of the STE (was announced on the System'89 flyer
and is still being advertised right now).

So a STE with no (working) SIMM-Slots must be considered broken ...

->OK, I take your point Neil but I still think some sort of statement from
->Atari about what exactly the new features of the STE were would have
->helped. If there was such a statement then fair enough, it is totally

To reiterate my former remark: It's not a journalists "assumption"!

Atari Germany itself on last years "Systems" exhibition in Munich
provided data sheets of the new STE which promised easy expandability
to up to 4 MB. I have a specimen of this sheet!

This promise has been repeated in Atari's advertisements in the meantime.

Since Allan (Sorry, Allan) uses a disclaimer, but Atari Germanys sheet
does not, I am willing to believe them, not him.
(And, btw, this expandability is the _only_ feature of the STE over the ST
which I consider relevant for me. Imagine: 4MB and NO NOISE!!!)

> ...
>I was trying to put Uniterm in an AUTO folder so I could (be lazy) and run it
>as the computer was turned on. It didn't work (any ideas?) and I got 4 bombs
> ... and then after the bombs I was returned to my
>desktop. ...

To get your UNITERM to start when you turn your machine on, you
may put the program called STARTGEM.PRG into your AUTO\ directory.
Also you make a file called STARTGEM.INF and put it in the root
directory. This file has the name of the program that you want to run.
This program you run does not have to be in your home (or boot) directory.
For instance, I like this combination:

C:\AUTO\STARTGEM.PRG
C:\STARTGEM.INF

and the .INF file has one line, namely

D:\GULAM\GU.PRG

I put the startgem program so it is last program in my AUTO directory,
so that it runs after the ramdisk, the screensaver, the corner clock,
and any other good things. When the system boots, I see the icons and
windows appear on the desktop, and then these thing disappear as the
program runs.

I hope this helps.

This is just a guess, mind you, and if I'm wrong, please, don't everyone jump down my throat.
(standard disclaimer for all posts on the net)

The blitter, (again, I think), is just a device to move chunks of memory back and forth rapidly; it doesn't actually perform the routines to draw circles or windows or other graphic objects. From what you said, the new Mac graphics chip will actually do all the calculations and plotting routines on its own, requiring only one short command, leaving the CPU free to perform other tasks.

> In article <9003100804.AA03794@ucbvax.Berkeley.EDU> DUJARDIN@FRESE51.BITNET writes:
>> BTW, Atari
>> doesn't sell 520 STEs at this moment, because it would be cheaper to buy a
>> 1040-expanded 520 than a true 1040 (as an expanded Mega ST1 is cheaper than a
>> Mega ST2 or ST4). Indeed, memory expansion goes cheaper and cheaper : an 1 MB

Atari is certainly selling 520STEs in the UK. You are right that it is
cheaper to buy a 520STE and expand the memory than to buy a 1040STE.
One dealer in the UK is offering an expanded 1mb 520STE for 345 pounds
(as opposed to 499 pounds for an official 1040STE) and even a 4mb 520STE
for 599 pounds (or 625 pounds, depending on which magazine you read).

Very tempting.

I've not seen any messages from Simon Poole in this newsgroup for a while. I guess he's got a job that keeps him away or has taken him into new areas of interest. Does anyone know if he's planning to do anything more with UniTerm? I'm not desperately worried, because I think version 2.0e works just fine. But it would be good if Simon were working on something new for the ST. (Shame he stopped working on and supporting DLII. I can see why he didn't want complaints from people who'd inadvertently mangled their disks while using it, but that program was well on the way to being excellent. 0.24 was the last version to be let loose, wasn't it?)

While I'm in a 'where are they now' mood, what's Tom Hudson up to these days? I heard he'd started writing programs for IBMs and suchlike, because there was no money to be made in the ST world. Is that true? What sort of stuff is he writing now?

Graham

2795. Mac Portable Clone

Newsgroup: comp.sys.atari.st
Date: 1990-03-20 19:42:57 UTC
From: keithr@vice.ICO.TEK.COM
Message-ID: <4851@vice.ICO.TEK.COM>
Source record: 242386

I read this is the March 19 issue of EE Times. I thought it was
interesting.

Colorado Springs - The first machine that allows a Mac owner to leave
his desktop Mac and go mobile has been engineered here by Outbound
systems Inc.

The Outbound Portable Computer borrows the Mac Toolbox ROMs for its
system software, delivering full Mac operation in a notebook computer
about half the size - and price - of Apple's own portable.

Outbound's host cpu is a CMOS 16MHz 68000 processor, the same found on
the $6500 Mac Portable. When docked to its Mac host via a peripherial
cable and internal adapter card, the notebook computer provides double
speed CPU operation and a second screen.

On its own, the 9 pound Outbound operates for more than 3 hours on
standard camcorder batteries. A $250 optional ROM package allows the
now ROM-less Mac to be accessed remotely as a file server - no screen
operation of the Mac is possible without Apple's Toolbox ROMs.

The Outbound display betters the Mac Portable's active-matrix LCD screen
by using a fluorescent backlit supertwist LCD panel. Outbound is the
first commerial user of the Isopoint screen-cusor control system, a
keyboard spacebar sized technology from Alps America that allows X-Y
screen control without a mouse or trackball.

A $2995 Outbound comes with a Mac and IBM capable floppy drive. $1000
more adds a 2 1/2 inch PrairieTek hard drive. Both versions allow
standrad DRAM single-in-line memory modules to be used as silicon
drives.

Looks like a bit of competition for Stacy and GCR if Stacy ever
produces.

2796. Re: Atari's blitter vs. the Mac RISC graphics unit

Newsgroup: comp.sys.atari.st
Date: 1990-03-20 19:53:20 UTC
From: dnewton@carroll1.cc.edu
Message-ID: <1344@carroll1.cc.edu>
Source record: 242391

It is my understanding that the blitter is merely a DMA device that will move chunks around and optionally perform one of a few logical operations on it. The Am29k in the new Mac graphics board is a RISC CPU which is dedicated to speeding Mac graphics. It is closer in function to the Amiga chipset but is still one level above it.

It is similar in function to the TI34010 boards for the PC series, simply a graphics engine.

BTW, what ever happened to that Really Cool graphics board from England? Does anyone have one?

>really think that this was indeed a 'first'.

It's almost a first in the Macintosh world. One company's been making a board based on the VLSI Logic ARM chip, but from what I've read about it, it's mainly used as a vectorizing engine for CAD programs, not an actual QuickDraw interpreter.

> Now I'm just a dumb 'Joe End User' but what about the blitter chips
>for the Atari ST and Commodore Amiga? The article also continued with
>phraseology similar to that of the ST and Amiga in that it said that the
>main CPU could now get on with traffic managing tasks rather than the
>actual graphics management. Still sounds like a blitter to me. If this
>is indeed a first then WHAT ABOUT the ST and Amiga chips? I mean, seriously!!?

While what Apple's doing goes a step further than the Amiga's blitter, it's still far from a first -- Workstations have been doing this kind of thing for years. Even PCs have various TI 340 based graphic boards which work in a similar fashion. The basic idea here is that the graphic boards understand a graphics language at a reasonably high level. The language could be TIGA, QuickDraw, Display Postscript; the language details aren't all that important.

A Blitter, even a clever one like the Amiga's, only works at a pretty low level. When you make a function call in your graphics kernel, for instance, a generic DrawBox() call, the CPU starts up, probably calculates any clipping necessary, and generates several blitter calls. Blitter calls generally move 2 (Atari) or 3 (Amiga) sources, with 16 (Atari) or 256 (Amiga) possible operations, then deposit a result at a destination. The Amiga's blitter also does hardware line drawing. But all of these are low-level commands. On a CPU supported graphics board, the graphics kernel would only have to translate the OS-supported DrawBox() command into the graphics language supported DrawBox() command. If the OS and the graphics engine support the same language, the only work the main CPU does is to send that command to the graphics engine, possible Wait()ing before going on (which lets other tasks use the CPU when you're multitasking).

So, if nothing else, this new Apple card is their first attempt at building a QuickDraw engine. Personally, I'm surprised it's taken this long, and that it's so expensive (around $2,000 as I recall).

Source record: 242387

Apparantly, the new Mac graphics board does not use any special RISC chip, but rather uses Advanced Micro Devices RISC processor. Performance should be comparable to the various Transputer type graphics cards for the IBM. Personally, I think it's a waste to have more processing power on the graphics card than in the CPU. They should have used a 68040 for the main CPU.

2800. software for kids

Newsgroup: comp.sys.atari.st
Date: 1990-03-20 22:00:09 UTC
From: toml@clara.UUCP
Message-ID: <681@alpo.UUCP>
Source record: 242392

my oldest boy (3 yrs 7 mos in age) just discovered that my ST is capable of fun things, as well as the boring stuff i usually do on it. specifically, we've been playing with a couple of PD arcade games, and a few rather abortive child-oriented PD/shareware applications.

i am interested in any recommendations anyone may have for software for a child this age (or in the ages soon to come). i'm interested in dorothy brumleve's 'kidware', but the little bit of it i've seen seems to assume more or less that the child can read. the same is true of the one or two commercial packages i've looked at (which, coincidentally, were also horribly ugly hacks).

i don't have very easy access to a software store, so any commercial works i buy will probably have to be upon recommendation. i am also interested in PD/shareware recommendations - i have access to panarthea and GEnie, the main problem is just knowing what to go after.

note that i'm interested in both 'educational' software (numbers, letters, etc) AND entertainment. he enjoys the hell out of shoot-em-up arcade type games (yeah, i know, i got a lecture from my mother in my dreams last night). his facility with a joystick or mouse is pretty limited currently, but he's game for anything - likely the simpler the better.

so, how about it, any recommendations (pro or con)??? go ahead and post them here if you care to.

thanks in advance.

Because most of us still don't have anything newer than 1.0!

Seriously, why not a 'separate' version with the software emulation for
the 'oldies' out here? A few #ifdef's would allow a common set of source
and those with the newer ROMs could take full advantage of them while those
of us who can't upgrade now could still get the advantages of Gemini albeit
with lower performance.

BTW, I REALLY LIKE the idea of merging something like Gemini with RTX or
some similar multi-tasking system. Sigh, just think if we could have
X11R4 ...

2804. Mega2ST question

Newsgroup: comp.sys.atari.st
Date: 1990-03-21 04:44:54 UTC
From: boyd@fsucs.cs.fsu.edu
Message-ID: <9003210445.AA04414@fsucs.cs.fsu.edu>
Source record: 242399

I have become interested in upgrading my Mega2 to a Mega4. My question is, is there any way of knowing what the status of my motherboard is pertaining to memory upgrade (ie sockets, no sockets, filled solder holes, impossible, easy, whatever) based on it's serial number (or some other distinguishing characteristic)? I do not want to open it up unless I have to. It was purchased about 2 years ago, and has a slanted disk drive thingy, with a large parellelogram style eject button.

For that matter, based on these things, can anyone tell me what kind of drive I have (Chinon, Sony, ??)?

> -- Howard Chu @ University of Michigan

I believe you MUST lose clarity on the monochrome image when viewed on a
color monitor, because of the color mask (little RGB dots) that is overlayed
on the screen itself (extremely bad description, but I hope you get the idea).
Any color monitor with a fine enough color mask to be unnoticeable in mono
mode would be extremely expensive, if it exists.

The longest SCSI cable that we have put on a BMS-200 is 20 feet, this is the maximum length allowed by the SCSI specs. The DMA cable supplied is 37 inches measured end to end, this is about the same length as the ICD dma cable.

>a maximum of 4 MB, isn't it ??

Maybe they can use 4M SIMMs (if there are any yet) so two of these
would make 8MB. (Just a guess).

>It may be true that upgrading a 500k ST to a 1M St would be cheaper than
>buying a original 1M machine, but in any case, ATARI is not going to sell
>any 500k machines in future (and they don't sell them now either).
>The minimum ram size is 1M.

Here in Sweden they sell the 520STE and it's about $250 less
than the 1040STE. For that money you can get a 2M upgrade
(If you order the SIMMs from US) so I see no reason for buing the 1040STE.

2811. Requesting information on Macintosh emulation packages

Newsgroup: comp.sys.atari.st
Date: 1990-03-21 10:24:03 UTC
From: adiro@TAURUS.BITNET
Message-ID: <1252@taurus.BITNET>
Source record: 242330
Cross-posted to: comp.sys.atari.st,comp.sys.mac

Hello,

I am considering buying the Atari Stacy with a Macintosh emulation
package, as a replacement of the highly-priced Mac-laptop.
Since I am new to the Atari world I would appreciate any answer to any
of the following questions:

1. What is the best Macintosh emulation package available?
2. How well does it emulate the Mac? Can one run ANY program that runs
on a real Mac ? I am especially interested in the different software
packages to define fonts, and then using the fonts in different
word-processors available for the Mac.
3. Is it really compatible in the sense that one can have a diskette
and work with the same software & data one day on a Mac and the other
on an Atari ST ?
4. How much memory does the emulation package consume ?
5. Does anyone have already some experience with the Stacy and such an
emulation package? How does the performance of a Mac software run
on the Stacy compare with, say, a Mac Plus or a Mac SE ?

Please send any answers to me at adiro@taurus.bitnet or adiro@math.tau.ac.il .
I will summarize and post if there is interest.

Thanks in advance

Adi Rosen

Announcement:

A WORKSHOP ON DESKTOP MOLECULAR VISUALIZATION

'an exploration of the role of personal computers in
molecular modeling and graphics'

sponsored by the Molecular Graphics Society of the Americas

The limits of molecular modeling, graphics, presentation, and
molecular biology visualization on personal computers (i.e.
IBM PC's, Apple Macintosh, and the NeXT machine) will be explored.
The workshop will include invited speakers as well as contributed
talks, posters, and vendor displays. Workshop proceedings and
demo software will be distributed on CD-ROM.

when: Aug. 23-25,1990 (right before the ACS meeting...)
where: Holiday Inn, Bethesda, MD.

If you are interested in attending or speaking please contact:

Dr. William R. Light, Code 6090, Naval Research Lab
Washington D.C. 20375-5000
telephone: (202) 767 1154 arpanet: Light1@nrl3.nrl.navy.mil

have a 3D and have in the past had both the Goldstar and Samsung Atari color monitors, and the Goldstar sm124. I think the 3D beats them all, easily, in all modes, and is 14" not 12 to boot. The digital screen controls are really neat, and this should work with any new atari machines also. Really cost effective vs. two el cheapo (made) atari monitors, NEC is QUALITY.

>--
> -- Howard Chu @ University of MichiganWell, I personally think the 3D is CLEARER than the sm124. I never really liked the sm124's really small (to me) size, even tweaked up big as it'd go. But the 3D has a big 14" screen that it lets you use most of (a good FULL 13" anyway) and feels "workstation-like" compared to the sm124.

2818. Gemini & Uniterm problem

Newsgroup: comp.sys.atari.st
Date: 1990-03-21 14:52:45 UTC
From: viljanen@cs.Helsinki.FI
Message-ID: <4602@hydra.Helsinki.FI>
Source record: 242317

I just got Gemini from binaries-group and I like it. But I've got a slight problem with it, Uniterm and my Mega 2. When I execute Uniterm 2.0e from Gemini and use it for some time, I get 2 bombs. Always.

The time for the bombs varies, they usually come after an hour or so, but the current record time is about 1/2 hours.

After the bombs Uniterm dies and I'm back at Gemini. Usually the desktop is so dead (no mouse pointer anywhere etc) I have to reboot. Sometimes it is somewhat alive, but it doesn't work correctly.

Has anybody met these symptoms? Is there a cure?

2819. Atari Financial condition

Newsgroup: comp.sys.atari.st
Date: 1990-03-21 15:08:12 UTC
From: cmm1@CUNIXA.CC.COLUMBIA.EDU
Message-ID: <CMM.0.88.638032092.cmm1@cunixa.cc.columbia.edu>
Source record: 242316

OK, I have finally dug up the reports on Atari's financial condition (which isn't too good). I have reviewed the agreement between my company and the source of the report and I don't feel comfortable about posting it to the net. (Getting sued would really bum my ride.) So all who are interested (within reason) send me an email request and I'll send you the highlights of the report. thank you for you patience.

For all those who have been doubtful about the decline of Atari's finances, just take al look at their current ($6) stock price. If I am not mistaken, Atari was selling at an all time low of 4.5 right after the Black Monday crash. About 6 months ago (I beleive) it was selling as high as $11-12. Now the stock market is at an all-time high and Atari's stock is sitting near the basement again. Everyone on Wall St. knows that Atari is in financial trouble and consequently the stock has lost most of its recent value. Even the release of the much-touted TT will really not help too much, as it will take some time to gear up production and a 16mhz 68030 machine is really not much of a splash (compared to what it would have been a year ago) and will not generate and incredible amount of interest in Atari (except for the loyal userbase it already has (most of whom cannot afford a $3K machine anyway)).

Face it, Atari is lounging around on its haunches TRYING to release a 16 mhz 68030 machine while most other manufacturers have had one out for some time now and have subsequently released 25mhz and 40mhz machines.

Where does this leave Atari? In trouble...big trouble. They are making money in other eareas, but in computers expect them to take some hefty losses in the next 1-2.5 years.

As ever, this is my own humble opinion. Your mileage may vary.

Chris

2821. HP Deskjet Plus and the Atari ST

Newsgroup: comp.sys.atari.st
Date: 1990-03-21 15:49:50 UTC
From: rcd@cbnewsj.ATT.COM
Message-ID: <4275@cbnewsj.ATT.COM>
Source record: 242327

My brother just bought an HP Deskjet Plus for his ST. I remember people reporting power up problems that affect the ST's parallel port when this printer is attached.

There seems to have been two kinds of problems: 1) the Deskjet Plus allegedly causing hardware damage to the ST's parallel port and 2) a problem that causes TOS not to print to the Deskjet if the wrong power up sequence is used.

Problem 2) had to do with the STROBE line, and I have saved John Logajan's article detailing a PNP transistor attachment to fix it.

Now, what was the conclusion to problem 1)? Is it true that if the DJ Plus is directly connected to the ST parallel port, damage can be done to the port? Thanks for any replies, and I'm sorry if this has come up before.

>
> Dave

Well, one of your problems is apparant - UNITERM can't be run directly in the
AUTO folder. Uniterm is a full GEM programs and GEM is not loaded until AFTER
the programs in the AUTO folder are run first. Almost any GEM program run in
the auto folder will bomb...

Conclusions? I hope that doesn't mean the end of your experiments. If
it worked even at 125Khz, SGS net would be speeded up considerably,
and 250Khz is faster than Localtalk (= Appletalk - runs at 230Khz). I
haven't got the specs for the optoisolators, but a quick trip to Radio Schnook
could give you a good idea of the speeds tolerated. Look for (rise)
time or frequency related specs on the back of the bubble pack of
isolators, or you could just proceed by trial and error (especially
good if the isolators are not the only bottleneck).
Hoping to hear more about it,

Bob Pegram (Internet: pegram@griffin.uvm.edu, UUCP: go figure.)

2827. Vcel Animator Demo

Newsgroup: comp.sys.atari.st
Date: 1990-03-21 18:19:29 UTC
From: johnsoer@thor.acc.stolaf.edu
Message-ID: <11772@thor.acc.stolaf.edu>
Source record: 242322

comp.binaries.atari.st now contains a usable demo version of Vcel Animator. With Vcel you can create animations like those found on Monty Python's Flying Circus, or more sophisticated human simulations. The digitized human figure found on the demo files is actually me (Erik Johnson) in electronic form. If this demo at all intrigues you, then by following the intructions found under the info button, you can order the complete version for $25 off the retail price. Since I regularly read this newsgroup, you have direct access to the author of Vcel.

I am now trying to get this demo spread around the world as completely (and cheaply) as possible. Please upload this demo to any BBSs you belong to. Also, if anyone out there has a list of ATARI BBSs that they could share with me, the effort would be greatly appreciated. Names and addresses of sysops would be most helpful (mailing disks is cheaper than long distance uploads).

If you can help me, then thank you, but above all enjoy VCEL!!!

>some similar multi-tasking system. Sigh, just think if we could have
>X11R4 ...

Well, to run an X server (which, in X parlance, is the program that accepts commands for drawing windows and putting stuff in them, but doesn't actually determine what goes into them,) all you have to do is implement TCP/IP on the ST. That's already been done, in the KA9Q package. Then find a copy of the X protocol document and have at it. I'm pretty sure that a reasonable server implementation could be done on the ST.

The problem, though, is that you'd need a much faster network connection than the serial port's 19.2Kbaud. X is not really concerned with conserving network bandwidth, so your X clients would display very slowly on the ST. If you have an Ethernet box hooked up to your DMA port, you'd probably be okay.

To run X clients (xtank, xterm, xsol, etc.) on the ST, you would of course need a multitasking system. Not only that, but it'd have to be pretty close to UNIX-compatible, or you'd spend the rest of your life porting all the libraries and so forth. The obvious candidate is Minix. I'm not convinced that 4 megabytes is enough memory for all this, though -- X is not small.

But there are monitors around (like the original NEC Multisync) with a
monochrome mode switch, which let you select which of the 3 color guns to
use to emulate monochrome. (You could activate all 3, but that would be
self-defeating in this case.) If you only activated one, then you should
have a pretty fine resolution, yes?

2833. Supra V.42bis modem

Newsgroup: comp.sys.atari.st
Date: 1990-03-21 21:52:52 UTC
From: steve@thelake.mn.org
Message-ID: <A2124026997@thelake.mn.org>
Source record: 242328
Cross-posted to: comp.dcom.modems,mn.general,comp.sys.atari.st

The current issue of InfoWorld has an ad for the Supra Modem Plus, a 2400bps modem with MNP-5 and V.42bis data compression, for under $200 (US) from the On-Line Store, 800-336-2439. I've had good experiences with other Supra products, but I know nothing about their modems.

The ad says the V.42bis data compression can move bits at up to 9600bps and claims 8000bps with average line conditions.

I'd like to hear from anyone who has tried this model and can tell me:
* about its reliability,
* how well it works with sites running other MNP modems,
* how well it gets along with Telebit T2500s,
* whether I can get a better deal straight from Supra. :-)

If you have a better suggestion in that price range, I'd like to hear it.

My main application is moving uncompressed text files -- Usenet news and UUCP mail.

Please reply via mail. If there's enough interest I'll summarize.

2834. Re: Atari Financial condition

Newsgroup: comp.sys.atari.st
Date: 1990-03-21 21:57:53 UTC
From: saj@chinet.chi.il.us
Message-ID: <1990Mar21.215753.8966@chinet.chi.il.us>
Source record: 242329

Chris Mauritz has been saying scary things about Atari finances lately. I just wanted to make a few fairly obvious, but calming, observations. First: we almost lost Atari in the Federated mess. I suspect that the accounting by which there was still something left after the bills for that one were paid wouldn't stand close examination. The natural consequence of massively overstating the worth of a company at a particular time, is that the company won't seem to be doing very well in adjacent time periods. So Atari doesn't seem to be doing as well now as a fair count would show, because they borrowed from the future last year. Chris observes that the TT won't be a money maker early on. I wonder what that has to do with anything (except perhaps the urgency with which it gets shoved out the door). Near as I can make out, the possible bill-paying products for Atari this year are the Portfolio and the Lynx (I know, they aren't STs. The likely ST money maker is the 520, which the way I read things is about to become the first pleasant-to use home computer in the US below $700 ->In The Configuration Used<-. STacy may make a bit of money this year, but in the short run it's a PR item. The TT is business for the future. The Mega line looks like the developer/academic special, especially if E graphics and sound catch on. The ATW and ABC don't appear to apply to the US market at all, although I understand that profits from ABC are very welcome.
Bottom line: if Atari was going to fold soon, they would have done it already. But don't put the pension fund into Atari stock.

2836. Yet another screen saver question

Newsgroup: comp.sys.atari.st
Date: 1990-03-21 22:51:00 UTC
From: Ritzert@DMZRZU71.BITNET
Message-ID: <900321225131.250587@DMZRZU71-UNI-MAINZ--GERMANY>
Source record: 242315

there has been a lot of discussion on the varios screen savers. What
about this alternative:
switch the monitor off while the machine is doing a run of several hours
(for example, making gnu c or TeX fonts).

This may be in addition to a software screen saver.

Question to well informed people: is there anything in the st (mega) or
the monitor (sm124) which might get overloaded or damaged if the computer is
running and the monitor is switched off?

If not this method should be the best for the sm124. If You run the
sm124 24 hours a day, some parts in it are really prone to get damaged,
e.g. c711 and c915.

Michael Ritzert

Source record: 242337

Is anyone interested in becoming involved in a snail mail list of ST users? I know that most of you will be like me and quite happy using the Email facilities at your site, but spare a thought for us final year students who will soon be losing all access to such facilities if the company we join has not network links!! (Arrgghh, too horrid to consider!). So to get around this I was wondering if any of you would like to help me get a list together of interested parties who could then keep in touch and prevent themselves losing touch with the ST community at large (this would be especially easy if someone who still had net access could summarise current topics or forward news and advice!)

I'm not thinking of anything major league for the entries on the list, just sort of name, address, interests and optionally a few lines about yourself.

eg Simon Chappell.
s61304@uk.ac.psw.pa (goes away after June)
51 Amherst Road, Penny-Come-Quick, Plymouth, Devon, PL3 4HJ. UK.
C, operating systems (UNIX, VMS) & relational databases.

This would be roughly what my record would read, so if you are interested compose something for yourself along the above lines (you can have 5 lines of text about your self if you want! :-) and send it to me either by Email (until June) or at the above address (anytime). I am working now on a list for the UK and when both lists are complete I will Email a copy to everyone that wants one.

I hope that this generates a reasonable level of interest, so don't be shy! Contact me sooner rather than leter and lets all keep in touch! :-)

Regards,

Simon

>386 since I can't get to the atari for quite awhile. Thanks.

I had the same problem. I found that I had a virus on all my atari disks. It is called the Key virus, and you are more likely than not to have it also. It can be eradicated with Vkiller, available from terminator (new version just came out). Also, I use a program called PS2FORM, gotten from panarthea to format my disks for IBM use. It might also be on terminator. You must get rid of the virus if you have it, or any IBM disk will be unreadable after insertion in the Atari (only unreadable on the IBM's, the atari will not complain). This drove me nuts for awhile, and it feels nice to be virus free.

>Please reply E-Mail
>Thanks John Stiborek

I own an 296N and I think it's a good mechanism to own. It's shining point is
that it is the best deal in town in price/capacity ratios (or at least when
I brought it about a year ago).
It has performed flawlessly in conjunction with a ICD host adaptor and
formatted in 1:1 interleave. This is what I set it up for, but I'm not sure
if it's actually 1:1 interleave, but it's fast enough so that I don't care.
The only problem is that this is my second one. The first one I brought died
in a week, so I sent it back and got a new one.
The 296N is the only drive I have owned or worked with, so I don't know how
it performs against other drives, but in my book it's solid and reliable.

>Now, what was the conclusion to problem 1)? Is it true that if the DJ Plus
>is directly connected to the ST parallel port, damage can be done to the
>port? Thanks for any replies, and I'm sorry if this has come up before.

I measured the voltage levels on the data lines cause by the 2000 ohm pull-up resistors in the HP DeskJet Plus. The low levels were under 3/10ths of a volt, well within the 8/10ths of a volt maximum-allowable standard TTL low level. (There is no maximum-allowable high voltage beyond the supply voltage of 5 volts to worry about -- the pull-up resistors will never pull it over 5 volts unless they decide to become electrical generators -- which would be bigger news than cold fusion!)

Now, in my line of work, I've had logic outputs shorted to power, to ground, to each other, for days on end with constant power applied (and some of the chips got damn hot) but I've never burnt one out on that account!

In this situation we are talking power differences LESS than 1/1000 of a watt.

Logic outputs are designed to take a beating -- temporary shorts etc. They are designed to meet specs at rate levels of voltage under varying power supply conditions and extremes of temperature.

If you don't get my gist yet, THERE IS NO PROBLEM with the data lines.

Source record: 242336

[Steve Jacobs' posting about Atari's health deleted]

Whoa! I didn't say that Atari was going to close up shop tomorrow. What I mean is that they are going to be losing money for a while in the computer area of their business. Their R&D is just too far behind the competition.

re: Portfolio

I have heard from a friend who works at J&R Music World (they carry and sell a lot of Portfolios) that they are having a LOT of returned defective machines. Besides, who would buy one of the things for $400 when you can pay another $100 and get a very usable Toshiba laptop with standard size floppies, more memory and the availability of DOS versions above 2.1? Granted, the machine is small and cutesy and you can pop it in your briefcase, but it is rather fragile, expensive and difficult to type on. If it was $250 instead of $400 it could compete with the Sharp Wizard as a nifty little mini-electronic notebook, but it is too expensive and breakable for that. Honestly, what are those marketing guys thinking?

re: STacy

Now here is the sleeper of the year. If Atari can get these babies out the door and improve the battery life, they will have a winner. Hehe, it is funny to note that most of them will be used to emulate Macs.

re: ATW

What ever happened to this machine? It has been in developer hands for ages now and nobody seems to have written anything of consequense for it and you still can't buy one.

re: Megas

IMHO, this machine is going to die a slow painful death. It is impossible to develop anything for the critter as there are more board revisions out there than there are people named Jones. Just ask Avant Garde how much of a headache it is to prepare for this. I have seen 5 or 6 STs opened in my life and they all had different mother boards...tsk tsk... That is a no no if you want people to spend THEIR hard earned money to develop a product for your machine.

re: 520 ST taking over the "cheap computer" market

I don't think so. The Amiga 500 is about the same in price and is better suited to play games (which most people will do with a $300 computer anyway). Also, the Amiga is MUCH easier to upgrade if the user desires more power in the future. The poor 520st user has to throw his machine away and buy a better machine or pay someone to do a hardware hack (like an accelerator

board). How many average home users will want this kind of hassle when they can just plug in new RAM and other goodies into an Amy. Also, Commodore is doing a MUCH better job at advertizing.

Wow, this letter seems a bit harsh, but I don't think I've said anything that is grossly inacurate. If I have, please correct me. Atari's computers are going to be in the bottoms of America's closets if the company doesn't shape up. This would be awful. Send letters to the brothers Tramiel and bitch. I did! When that didn't work, I bought another brand. C'est la vie...

2844. I need a STACY !

Newsgroup: comp.sys.atari.st
Date: 1990-03-22 08:35:21 UTC
From: jackin@vehka.uta.fi
Message-ID: <1038@kielo.uta.fi>
Source record: 242339

I am in the need of a portable computer.

I know I could get a MS-DOS machine, but I don't want to be
stuck to mere 640 kb memory (I know about MAX386, lim 4.0 etc. no good)

So how is Stacy ? Is she Alive and kicking and most important : selling ???
Any news, prices, places to order, would be *very* wellcome. I do live in
Finland, so I need to get it (stacy) by mail.

If you can help me, please do.
Thanks,

Markku M{enp{{

> mode would be extremely expensive, if it exists.
>
Since the resolution of the Nec Multisync 3D and several others
are around 1024x768 or so, and since this is almost twice the res of
the ST's "mono" mode, this amounts to around two by two pixel groups (a
group is 1 red, 1 green, 1 blue) at the bare minimum. In reality, just one
pixel group per displayed dot looks bad, so the 1024x768 resolution may have
more in which case there's more than four pixel groups per ST Monochrome dot.
In any case, this is on the same level as the sharpness of a scanline
boundary on the ST's mono monitor, if not better.
I've seen several Multisync monitors running monochrome modes of
far higher resolution than the ST, and with just as much clarity. It is
true, however, that because the ST was not "built" to work with another
monitor, impedence mismatches, interference, etc. can and will cause some
problems. For instance, "ringing" due to impedence mismatch and other
factors seems to cause a shadow effect (I could be wrong about the cause,
this is speculation from knowledge of RF circuitry). For this reason,
it's very important to pay attention to ground paths, circuitry, etc.

PS: No, I'm not associated with NEC. I just like their monitors.

Hi again,

second time I see this and second time I try to answer it:

There is a thing called BioNet 100 available from
Biodata GmbH
Flughafen Siegerland
D-5909 Burbach
Tel.: (+49) 2736/50005-6
Fax.: (+49) 2736/5152

and also from these companies:

Switzerland: Impuls Informatik,
CH-2504 Biel

URWA Electronic,
CH-2504 Biel

Spain : TOU,
E-46008 Valenzia
Italy : Euro Soft snc.,

I-50134 Florence
Norway(?) : Futura Datasenter A/S,
Box 91,
N-5580 Olen
Netherlands: Faster Systems,
NL-5641 Eindhoven
USA : CHI-Cheetah,
CA-94960 USA
Gr. Britain: Signa Publishing Systems Ltd.
Alexander House,
Aldershot
Hampshire GU 11 1BQ

or so.

The following is taken from the latest ad in c't, the German magazine 'fuer
Computertechnik', as are the addresses above:

Atari ST, MS-DOS and UNIX all in one network.
Gateways for DECNET, SUN NFS, Novell, etc.
10 MBit/s according to Ethernet/Cheapernet standard.
Every machine working with it's own OS.
Handling on the ST with an accessory.
MS-DOS PC as deddicated server with partitions up to 2048MB.
Atari ST as non-dedicated server (16MB partitions).
Network security features including timelock and privilege levels.
Spooler for all printers in the network (including laser printers).
Mailboxes for messages and graphic images.
Reliable transport protocol TCP/IP.
Logging into hosts using telnet, datatransfer with NFS.
Crash-Recovery for crashing systems.
Backup-Server for critical applications.
Private disk per user possible.

That wwas the info from the ad. There was some more advertising hype which I
won't translate here.

Anyhow, for info on one possible Ethernet connection contact BioData.

Martin

Disclaimer: I do not work for BioData GmbH, nor am I associated with them.

>hitches? How about a 1.2 Meg drive - anyone tried that?
>
I tried taking out the chinon 720k drive which was built-in to my 1040
and replacing it with a panasonic 720k
(the stupid drive burned out) and THAT
didn't work... The cables fit perfectly, but when I turned my computer on,
the drive would just spin infinitely - never seeking. I tried this
on another panasonic - same thing. I think standard IBM drives
don't work properly on the ST - perhaps some jumpers must be set
but the techie folks at the store I bought the drive from had no idea
how to do it.

>One dealer in the UK is offering an expanded 1mb 520STE for 345 pounds
>(as opposed to 499 pounds for an official 1040STE) and even a 4mb 520STE
>for 599 pounds (or 625 pounds, depending on which magazine you read).

This is great stuff but we'd better get our orders in quick. Atari UK
may start selling the old STFM's with a slightly-serious-pack (ie. not
many games but Kuma business software) for 299 pounds but at the same
time increasing the price of an STe to 300 pounds without any supporting
pack. This is apparently to make it clear that the STe is definitely an
upgrade.

This seems slightly crazy. Who's going to write software for the STe
when most customers are taking advantage of a cheaper STFM (which Atari
UK now seem to be pushing as a business machine!).

The only way to go is to get rid of the STFM sales and force people into
moving ahead with the STE (at the price it is at the moment - 399 pounds
with the large software pack).

Is Atari US going to try the same thing?

Mark.

2852. Word Perfect and Revolver Crashes

Newsgroup: comp.sys.atari.st
Date: 1990-03-22 14:35:00 UTC
From: JOHNBARNES@ENH.NIST.GOV
Message-ID: <9003230849.AA00697@ucbvax.Berkeley.EDU>
Source record: 242413

I tried the combination described by Imran Anwar in the spring of 1989.

The combination of Wordperfect and Revolver does indeed lock up. I pursued the Issue on GEnie and found some references to the subject in one of the topics there. It seemed that each program has its own way to handle the mouse.
I have not pursued this subject further because NeoDesk gave me an adequate solution to switching between applications.

I found Revolver tobe unstable for almost every combination of applications thatI wanted to switch between.

Additioonal information should be available from Intersect and from WordPerfect.
This incompatibility is a known one. I do not know whether TOS 1.4 fixes the problem and I have not pursued the issue of an update to Revolver, but I'm fairly sure that there is a newer version.

2853. Problems with dutch TOS 1.4

Newsgroup: comp.sys.atari.st
Date: 1990-03-22 14:47:00 UTC
From: MFAGKCHR@HMARL5.BITNET
Message-ID: <9003230850.AA00712@ucbvax.Berkeley.EDU>
Source record: 242414

Hello,

This may have been discussed before. I haven't read the net since a long time.
Last week dutch TOS 1.4 ROMS were installed in one of our mega-2 systems.
I found some nasty problems, which I don't like at all:

1) I get lost and cross-linked clusters on the harddisk.

The harddisk is a megafile 30. I use CBHD 3.5, the harddisk driver
from the german 'Scheibenkleister' book. This did run very well
with TOS 1.2 (and 1.0). In the auto folder only environ.prg (which
sets the environment strings for TeX) and TOS14FIX.PRG are used.
(I do not use poolfix3, because it can not load after CBHD).
TURBOST16.ACC is the only accessory used.
I use GULAM, which is installed to autostart. I couldn't relate
the problem to a specific program. Although I noticed that most
problem files were created by SEDT or TeX (the TOOLS version), but than
most files are created by those 2 programs anyhow.

The problem might be a virus problem. I did get an old megafile 20 harddisk on
the same day. The disk was not empty. There were very much harddisk problems on
that disk, and I did send it back. I'm not sure however, whether the
a virus may have been transported from one system to the other.

2) Sometimes the system does not boot correctly, or I can not start
anything from Gulam.

Well, I have a lot of related questions. But I will post them separately.
The first problem described above is by far the most important.
I hope somebody has an answer.

> of the following questions:
>
> 1. What is the best Macintosh emulation package available?

In many people's opinion, Spectre GCR from Gadgets by Small (303) 791-6098.

> 2. How well does it emulate the Mac? Can one run ANY program that runs
> on a real Mac ? I am especially interested in the different software
> packages to define fonts, and then using the fonts in different
> word-processors available for the Mac.

Not ANY program, but its compatibility is impressive enough for most people.
For example, I used Fontastic Plus to create and edit a font, which I then
used from within MacWrite 4.6 and MS Word 4.0. Other programs that run on it
include MacPaint, Superpaint, MacDraw II, Pagemaker 3.0, Excel, and Hypercard.

> 3. Is it really compatible in the sense that one can have a diskette
> and work with the same software & data one day on a Mac and the other
> on an Atari ST ?

In my experience, on a 1040 ST, yes. I have formatted MAC GCR disks from
within the emulation (under the "Initialize Disk" dialog), and taken them
to a real MAC SE/30 at work, and they read and write fine there.

> 4. How much memory does the emulation package consume ?
On a 1 Meg 1040 ST, you are left with 832K that the Mac mode can use. This
can be used to run Hypercard, provided you don't have other memory-hungry
Inits or DA's running. If you upgrade to 2.5 Meg, you are left with
2240K or 1920K of Mac memory, depending on whether you turn on the RAM cache
or not. This is good enough to run most memory-intensive programs in
combination with fancy Inits and DA's.

Message-ID: <2985@castle.ed.ac.uk>
Source record: 242346

In article <2981@castle.ed.ac.uk> aimd@castle.ed.ac.uk (M Davidson) and
in article <2380@syma.sussex.ac.uk> grahamt@syma.sussex.ac.uk (Graham Thomas)
write about UK pricing on various ST models, particularly 520 STe/STFM

The proprietor of the local Atari dealership told me a few days ago that
the STe's (I'm 95% sure he said 520STe's) that he is currently selling
were delivered to him against an order for STFM's; he is selling them
out at the old STFM price, since they were invoiced to him at the old
dealer price for STFM's. He does not expect to continue doing so after
models ordered by and invoiced to him as STe's actually arrive. This would
suggest that Atari UK is out of 520STFMs.

So Mark, perhaps you had better get your skates on down to Antigua Street,
before the cheap STe's are sold out!

>
>Whoa! I didn't say that Atari was going to close up shop tomorrow. What
>I mean is that they are going to be losing money for a while in the computer
>area of their business. Their R&D is just too far behind the competition.

Atari made money in the computer area of their business in the 4th quarter of 1989. Giving that revenues and profits lagged for 3 quarters and now new products are shipping in a quarter in which revenues and profit rose, it seems clear that Atari is entering a new product cycle. The figures don't support your assertions.

>re: Portfolio

[criticism of Portfolio deleted]

If you think the Portfolio is so ill-positioned, you must think people are really stupid to pay $2000 for a Poquet portable. After all, it has no more features than one of those Toshiba things, but it lacks a floppy drive.

The market, not the pundits, will determine the Portfolio's success. Thus far Atari has sold a bunch of them. Of course, they have to get their defect rate down, and they will have to discount the price from its current level.

>re: ATW
>
>What ever happened to this machine? It has been in developer hands for
>ages now and nobody seems to have written anything of consequense for
>it and you still can't buy one.

There have been several postings from people in England who have bought production models. It seems that it is being marketed as a niche product in England, which is much more interested in the Transputer than the US.

>re: Megas
>
>IMHO, this machine is going to die a slow painful death. It is impossible

>to develop anything for the critter as there are more board revisions
>out there than there are people named Jones.

Joe Average User doesn't buy hardware upgrades for his motherboard,
other than memory. Personally, I'd rather buy an STe if I could choose
any ST model just because it's so cheap to plug in SIMMs.

>re: 520 ST taking over the "cheap computer" market
>
>I don't think so. The Amiga 500 is about the same in price and is better
>suited to play games (which most people will do with a $300 computer anyway).

Compare the STe to the Amiga 500. Given that all STes have SIMM slots,
it's easier and cheaper to upgrade STe memory than Amiga 500 memory.
Each entry-level system has its strengths and weaknesses, and I doubt
either one is going to eliminate the other.

>Wow, this letter seems a bit harsh, but I don't think I've said anything
>that is grossly inacurate.

Well, your claim that Atari is "highly leveraged" was never confirmed,
and you seem to think that Atari is losing money when they're making
money. You also might consider that they are at the beginning of a new
product cycle. If revenues remain at about 450 million $, and profit
rise to a mere 10% (they've done better in the past) , then the stock
at its current price will end up around 10:1 P/E. It's probable that
revenues will actually rise 20% or more in the next year. I'm very
surprised that they earned anything in 4Q89 despite making big
investments in new product production.

Obviously Atari is not a safe investment. But, IMHO, it is not a bad
investment at the current stock price.

> Atari's
> computers are going to be in the bottoms of America's closets if
> the company doesn't shape up.

Revenues are rising also. Have a nice day, and please post some
facts about Atari's long-term debt.

I have version 1.11 of this program, and it also claims to be able to handle
Postscript printers. I don't have a postscript printer, but I'm going to try
the same trick you did to see if it works.

> I obtained version 1.12 last
>October.

I obtained my version in December 1988. I just called Timeworks, and they
swore that 1.11 was the latest Atari version, saying that 1.12 was IBM only.
Could you check to see that you really have 1.12 for the ST so I can followup
to them? If anyone else has 1.12, knowing that would be helpful to me as well.
Thank-you.

Well, any speed other than 500khz would mean installing a new crystal,
or sticking in a divider. Unless you had some external control over the
divider, both solutions would mean screwing up your MIDI and keyboard
baud rates. But if that's not an issue for you, then you can go ahead
and try it... It just isn't gonna be a software solution.

From: matthews@umd5.umd.edu
Message-ID: <6317@umd5.umd.edu>
Source record: 242405

I'm having some serious problems with Uniterm 2.0e (now 002, also with 009). The local tie-in I have to the mainframes as, well, gone to h*ll with some major line noise problems (it's the only place that gives me line noise, too), and Uniterm keeps locking the modem out, such that I have to reboot in order to use the modem again.

This is highly annoying.

Is there anything that I have set up incorrectly with Uniterm?

My system is a Mega 2 mono system with TOS 1.4 currently. I have the buffers set to 5KB RS232, and larger than standard buffers for everything else. Whatever I type before I reboot is sometimes (can't remember if it's always) sent to the modem after Uniterm is loaded again.

Your posting was rather annoying, as I TOLD you that I was going to send you the complete financial report when I got it into computer-readable form (which I have just completed today). For your information, the company's debt/financial worth ratio is roughly 3 to 1. I would call that HIGHLY leveraged wouldn't you?

Not only that, but they have been consistently delaying payments to their suppliers (not a good sign) and have been REFUSED credit in the recent past because of it. They are MUCH less liquid than most companies in their industry and they have a very sluggish turnover in inventory.

Also, it doesn't help matters that their main trade facility is denominated in Yen (I believe it was for ~US$13,500,000) and thus will buy less in every market ecxept in Japan as the Yen depreciates.

I'm a bit tired so I'll save the rest of reality for later. I wasn't trying to delay this information and I resent your implications that I was somehow lying. The facts speak for themselves, Greg. Wake up and smell the coffee.

Have a nice day.

Hi,
in a german ST-magazine I've read an article about making a backup
from harddisk to videotape. I've never heard about this method, but
according to the article it seemed to be a very popular method of
making a backup.
My questions are:
How save is this system ?
What does it costs (of course without videorecorder) ?
Where can I get it ?

Bye,
Thomas

You have the disk drive cable upside down... This is just about
the ONLY thing that would make the motor stay on when the drive is
not being accessed.....

Good luck......

I'd try again if I where you just remember THE RED WIRE ON THE CABLE IS
PIN ONE...!!! and pin one should be marked on the connectory to the drive..

Pete..

2872. ***** HELP ******

Newsgroup: comp.sys.atari.st
Date: 1990-03-23 10:48:00 UTC
From: XUUM24@PRIME-A.CENTRAL-SERVICES.UMIST.AC.UK
Message-ID: <$TGKHDZRJDBGT.at.UMPA>
Source record: 242408

HELP !!!!!

My hard disk has decided to pack up. When I booted it up, it would go
through the normal sequence until it came to clear to the desktop.
Instead a lot of rubbish appeared on the screen, along with bombs,
and the machine reset to start going through the boot sequence again.
I had luckily backed up very recently so I thought I'd reformat
the drive.
When I did this the hard disk utility reported a 'FORMAT ERROR', so
now the disk does work. I phoned a couple of repair companies and
none were very helpful - mostly said 'Its f***ed - buy a new one'.
One of them said something about it needed 'Low level reformatting'
and that would have to be carried out on an Amiga, taking a lot
of time and costing a lot of money - why not buy a new one.
Can anyone out there sent me a program which can do this 'low
level reformat' without having to pay lots of money - difficult
as I don't have it.
This has really screwed me up - you don't realise how dependent
upon the hard disk you become until it isn't there.

Thanks in advance
Steve C.

A poor student desperately in need of help
PS. I should have said - the drive is a Triangle 20MB AT/HD20
and the software I tried was the Triangle hard disk utilities.

From: woodside@ttidca.TTI.COM
Message-ID: <11284@ttidca.TTI.COM>
Source record: 242410

Recently, David Beckemeyer mentioned the German paint program from the GEnie libraries (PUBPAINT.ARC) as a possible virus source. David provided me with more information on why he suspected the program. I downloaded it, and check it quite thoroughly. It does not contain, or generate, any virus.

David's suspicions were due to a function call the program made, which was rather unusual. It did indeed do what he thought, but not for the purpose of generating a virus. The program does do quite a few wierd sound effects, and handle a few functions in some rather unusual ways, but none of them are harmful.

2875. TIMEWORKS DTP WERE I GOT IT.

Newsgroup: comp.sys.atari.st
Date: 1990-03-23 14:27:50 UTC
From: CHIASSA@UDEM.BITNET
Message-ID: <ID6137.D900323.T102750.CHIASSA@UDEM>
Source record: 242439

Chris Jones asked for verification of my most recent version of TDTP. Yes indeed it is V1.12, that's what comes up on the screen and what a small piece of paper said that came with my update. That small piece of paper described the new feature of printing postscript files to disk. However, I did not get my update directly from TIMEWORKS but from GST SOFTWARE PRODUCTS LTD., T/A ELECTRIC DISTRIBUTION, MEADOW LANE, ST IVES, HUNTINGDON, CAMPS, PE17 4LG, TEL. (0480) 496666. It took several months for the mail to travel back and forth from Canada to England but it eventually got to me in October 1989. The update is solid as a rock, I've observed a few strange things but it has never crashed. Hope this helps.

Source record: 242425

Ops - rn put my message in the Keywords line, highly truncated. I'll try again.

The midi port and the keyboard port of the ST both use the same 500 KHz clock, but it is simple to make the UARTs clock inputs independent. All it requires is cutting one trace on the PC board. I did this to change the baud rate for the midi port. It is documented in deckeybd which is archived in comp.{sources|binaries}.atari.st.

On the other hand, you cannout run a UART asynchronously with its baud rate equal to its clock rate. That, with or without the optical isolators, doomed Howard's (I think it was ..) experiment. You need to use a 16X clock. I don't remember the max clock input on the ST's UART, but I don't think it is nearly fast enough for AppleTalk speed.

Hello all! I'm looking for some software to drive a SCSI
tape drive. The drive in question is a Teac MT-2ST/45S-24-U.

My current setup is
Mega-4, Supra host adapter, ABC-4070 with a 30 Mb drive, and
a Shugart SCSI to MFM card with a 30 MB disk. I'd like
to be able to use the Teac for backups and long term data
storage.

I'd also like pointers on how to write C code that will get
at the SCSI bus. My compiler is Mark Williams C.

Send me the information and I'll post a summary to the net

NOTE: my e-mail address is goldman@ferris.cray.com, not
goldman@timbuk.cray.com! Timbuk is the machine that I post from.

Thanks!

2888. Nethack 3.0 patchlevel 7 binaries on Terminator

Newsgroup: comp.sys.atari.st
Date: 1990-03-23 23:50:39 UTC
From: zz1jm@sdcc4.ucsd.edu
Message-ID: <9297@sdcc6.ucsd.edu>
Source record: 242433

Howdy!

There have been several requests for the new nethack binaries. I
was wondering if there was someone out there who was mailing off
the files to those people or not.

If so, perhaps we could find some central clearing house for
requests.

At any rate, for those of you with ftp access, there is now
a file "nh3_pl7.lzh" in the atari/new directory on terminator
[35.1.33.8]. It is a bare essentials file will the executable
and all the primary support files. The Guidebook, man pages &
misc. docs are ommitted. It does run though. The font maker
"hackfnt.prg" is included--and does it look great! @8^)

I'm outta town after this Saturday so I can't mail out a
6 part uuencoded file until next week. Maybe some nice person
out there would take care of that.

I don't know what the schedule for patchlevel 8 is. It may be that
we should wait for it before re-submitting to the archives.

Happy NetHacking!

P.S. I didn't mention anything in the rather brief readme I stuck
in there, but if you get the program up and running, could you drop
me a line? I'd apreciate it.

2889. Panarthea may be out sometime next week.

Newsgroup: comp.sys.atari.st
Date: 1990-03-23 23:53:18 UTC
From: koreth@panarthea.ebay.sun.com
Message-ID: <1386@male.EBay.Sun.COM>
Source record: 242421

Panarthea is moving to new hardware, so the archive server may be unavailable for a short while next week. It should not go away for more than a day or so, but I don't want anyone wondering where it's gone. Archive users will not notice any change in functionality (except that the requests may be serviced a split-second faster...)

Patchlevel 8 should be out "Real Soon Now", i.e. a few weeks. The major holdup is the PC overlay scheme, which is quite tricky and seems to have some subtle bugs. Once those are cleared up I'll send copies of pl8 binaries to terminator and maybe some other archive sites. If there's a lot of interest I'll post to comp.binaries.atari.st.

Patchlevel 8 fixes the usual bugs, and the TOS version has better color support (you can turn the colors on and off as you're playing) and allows control+number-pad combinations. I'll try to put a real readme in there too.

2895. Useful Article on SCSI Bus

Newsgroup: comp.sys.atari.st
Date: 1990-03-24 04:22:39 UTC
From: FCTY7284@RYERSON.BITNET
Message-ID: <90Mar23.233151est.57419@ugw.utcs.utoronto.ca>
Source record: 242441

A useful article on simple interfacing to the SCSI bus, currently appears in the April/May issue of Circuit Cellar Ink: The Computer Applications Journal, page 15.
The article shows how a subset of SCSI commands can be used to interface to equipment without requiring a microprocessor controller at the receiving end.
It would be really useful if someone in the know would specify the differences between true SCSI and ACSI, and what the adaptor board does in the SCSI interface. I've seen requests for this in the past, on the net, but never seen an answer....
Incidentally, Circuit Cellar Inc is a terrific source of applications info for hardware and software projects. The current issue also has an article on computer generations of holograms, using VGA resolution if you can believe it!

>else seen problems like this with Vault?

I was getting two bombs after going through a couple of
screens until I rebooted with an (almost) empty \auto
folder, no accessories, and I ran vault right after booting.

Running almost any program before running Vault would give
me bombs. Mind you, I didn't bother with much experimentation
after I was able to get a good backup.

>this drive with Spectre?

I also was interested in getting the GTS-100, but thought I had heard
that it didn't work with Spectre. However, just last night I happened
to read an article by Dave Small in ST World, titled "When Networks
Collide or: GEnie meets Usenet", where he states (under 'Gadgets Rumours
& Innuendo'):

There's a Future Systems (everyone says "Indus") GTS-100 drive
here that now works with GCR. This is the only brand of drive that
gave GCR trouble; five minutes with a soldering iron fixes it. This
hasn't been done before. We've posted instructions. More on this later.

2903. ZOO Bugs

Newsgroup: comp.sys.atari.st
Date: 1990-03-24 18:50:34 UTC
From: SOFPJF@VM.UOGUELPH.CA
Message-ID: <9003250802.AA01472@ucbvax.Berkeley.EDU>
Source record: 242442

I have ZOO.TTP (and sundry other files in the package) that states that it is verion 2.01STe 1988/08/25. The documentation says the author is Daan Joesephus Jitta, and gives me an arcane (to me anyway) set of addresses. Anyhow, I thought: Gee, here's a neat way to back up a whole partition on a minimal number of floppies: ZOO it, then use a program I found someplace called SPLITIT to break up the archive into floppy-sized pieces. Sure it's slow, but the ZOO step should run unattended, and later I'd have a LOT fewer floppys to switch. BUT:

1) -Backup of the directory for DBMASTER (remember that one?) fails on the file USEONE.HLP. This file is readable by MORE, the desktop COPY command, by ARC and by USEONE itself, so the file is OK, but ZOO gives "FATAL: Error reading input file."

2) (This one's less clear cut:) -backup of an entire partition eventually fails on " -- I/O error or disk full". Does not matter if the archive is on the same partition as the data being archived or not. Both partitions (15 MB each) are less than 1/2 full. Nothing else reports write errors on my HD.

3) In trying to pin down the first bug, I mis-typed the folder name, and the system locked up. Thus zoo -backup foo d:\bar*.* will lock up your system if directory "bar" does not exist. Not friendly.

Has anyone else seen these bugs?

[I'm running TOS 1.4, with the "rainbow" patch + poolfix3 + folder100 + cache10 - all standard Atari stuff - on a MegaFile 60, as 4x15MB]

I'm willing to help the author in any way I can. Hello Daan?

/PJ SofPJF@VM.UoGuelph.Ca

If an idea can survive a bureaucratic review and then be implemented,
... it isn't worth doing.

2904. floppy disk-change (again)

Newsgroup: comp.sys.atari.st
Date: 1990-03-24 19:28:58 UTC
From: logajan@ns.network.com
Message-ID: <1990Mar24.192858.1655@ns.network.com>
Source record: 242255

From time to time I've seen mention of replacement floppy drives not indicating disk change status. Since I've had a replacement drive for longer than my human memory works, I don't recall if the original could really detect disk change status either.

Looking at the pinouts and schematics for a 520 ST reveals that there is no dedicated "disk change" signal. So if the original Atari floppy drives could inform of disk change condition, that information would HAVE to be indicated in some way over the only lines available to do so, namely: read-data, track-0, write-protect, and index. Furthermore, these signals go directly and only to the floppy controller chip, so that if there is any disk-change detection going on, it has to be occuring there.

I will pursue this by looking into the specs of the floppy controller, but if anyone has any clues or knows the answer to this, let me know. Thanks.

2909. Re: MT CShell

Newsgroup: comp.sys.atari.st
Date: 1990-03-24 21:52:00 UTC
From: david.megginson@canremote.uucp
Message-ID: <90032422335919@masnet.uucp>
Source record: 242446

I bought MT CShell from David Beckemeyer a few weeks ago. It is, of course, fantastic. I sent a message to DB after I received it, but he did not send an answer, or more likely, he did and it bounced. I've answered most of the questions I had by working on my own, but here are two which someone may be able to help me with:

1) How do I use the ARGV environment variable? I know it has to be something like xArgs, which I haven't used yet. I want to be able to pass sickeningly long command lines to my own programs too.

2) How do I keep MT CShell from adding quotation marks here:
```
set copt=-a -p
program $copt -i${TCINC} $i
program gets
'-a -p' -id:\include myfile.c
```
instead of
```
-a -p -id:\include myfile.c
```
I thought that you could set a variable to a list of words, but MT-CShell is convinced that it has to be one word.

Thanks DB, or anyone else who can help.

2911. Internal Floppy Problem

Newsgroup: comp.sys.atari.st
Date: 1990-03-24 22:48:55 UTC
From: whitten@kuhub.cc.ukans.edu
Message-ID: <22598.260ba4f8@kuhub.cc.ukans.edu>
Source record: 242448

Recently, I've been having a problem with the internal drive
on my 1040stf reporting that the disk can not be updated because
it is write protected. Reinserting the disk has no effect, and I
usually can't get it out of this write protect "mode" unless I
reboot the computer at which time everything is fine.

I tend to notice this problem after using the computer for a couple
hours, but I don't think the length of time that it has been
powered on is a big factor.

Anyone think they know what causes this? I've checked the
switch with a meter and it seems to be responding correctly...

One might also note I had the drive replaced when my other one
died, but this was not something that started happening immediately
after the replacement.

Thanks,
Chris

Why shouldn't it be complex and expensive to construct a new computer ?
And why should it help that IBM constructed a brain-dead computer based
on a brain-dead chip in '81. Atari didn't base this construction on this
and therefor your flame on Atari seems out of place. You can buy a PC
instead of flaming Atari for making machines adressing more than 1 meg
of memory. Not sure what your comment was indicating, really ?

Hello all,

Just wanted to nip a growing rumor in the bud. Seems that A-Max
is having difficulty in running System 6.04. On several of the nets
in this part of the Lone Star State, a lot of STers who don't have Spectre
are naturally assuming that the Spectre GCR can't run 6.04 either.
Well, so what?
Ok, the rumor continues with the idea that after System 6.03, emulated
Macs will not be able to run the newer Mac system software. I was shocked
how common this rumor has been in this area... all as a result of some
Amiga A-Max folks expressing distress over 6.04.
So to nip it in the bud... there is nothing to the rumor. I'm typing
this message on a Mega2 ST that's been upped to a Mega4, am running
System 6.04 on my Spectre GCR (version 2.3), and am in MultiFinder.
Interestingly enough, I have more memory available. Also, interestingly
enough, the Spectre appears to be 'snappier' and a bit quicker. I never
had an interest in 6.04 mainly because Apple says that it is for the
Mac IIci's and Mac Portable. Other systems supposedly won't benefit.
So, for what it is worth... System 6.04 will indeed run on an Atari
ST via Spectre. As far as the A-Max unit is concerned, this is a problem
of A-Max's own making.
Thanks again to Dave Small for making total and legal use of system
calls and algorithms instead of shortcuts to get OUR GCR to work!!!

Hello netters!
I am very interested in Zubair Interfaces' Z-RAM 3-D 4 Meg expansion board. If anyone has it, could you tell me how you like it. Did you install it yourself? How easy/hard is the installation? Will it easily fit into an old 520 ST with an RF modulator and an EXternal drive? Any information you send me will be greatly appreciated.
I would also like to thank all of you who send me email regarding my last post. I have decided to go with a commercial product because I am afraid that I would otherwise ruin my ST (I am nowhere near being a technical person.
Thank you much!
Hassen K. Hammoud

>
>-Bob

It does not look very good. I wish I had saved up my cash and bought a mono monitor. The emulation does work, and is quite an achievement, but the color monitors just don't have the resolution to give an acceptable display. Also, everything slows down miserably. Going the other way (emulating a color on a mono) is probably a much more useful job for this program. From recent postings, it appears that one can get a Multisync monitor capable of showing the mono resolution with equal clarity as the Atari monitor (both setups I have seen have not been as clear, but the postings indicated a need for a monochrome mode switch on the Multisync, in addition to the actual switcher for the two resolutions). The color display on such monitors is dazzling, much better than any Atari color display I have ever seen.

To my understanding, with the present size of the PC-Ditto II board, you would be lucky to be able to cram just it into an Atari. New smaller board should come out RSN. I understand that PC-Ditto II uses a clip which attaches to the 68000, and will not fit if one has anything glued/soldered on top or under it (I am not sure if Turbo 16 attaches that way).

2917. STacy

Newsgroup: comp.sys.atari.st
Date: 1990-03-25 04:50:26 UTC
From: ramsiri@blake.acs.washington.edu
Message-ID: <6382@blake.acs.washington.edu>
Source record: 242265

Yet another full page STacy ad in this month's
EM (Electronic Musician) rag... along with several mentions
of the TT.. (I laughed too!!)

There is something blatantly ridiculous in the photograph
of the STacy running NOTATOR.

I asked my wife: "What is wrong with this picture?"
ANS: "It is black [intoning the case was ugly]"
To which i responded: " Look again "
immediate ANS: "Well, the notes look ridiculous..."

Seems like *** 9 *** ledger lines below the treble cleff
might be a bit much.... ;-) I guess the "stylist" at
ATARI just wasn't up to hitting the "S" key that day....
Then again, why advertize something you know about....
that wouldn't make any sense ..

Of course, a musician who doesn't read music won't know the
difference.. maybe this is the market for which ATARI
is demonstrating NOTATION sofware ..interesting marketing idea...
a little backward maybe ;-)

ACTUALLY... ridiculous blunders like this make a big difference...
Chip, chip and chipped away!

-kevin
ramsiri@blake.acs.washington.edu

BTW: aside from the unjustifiable notation absurdity,
the advertizement is of EXCELLENT quality.. one that
really catches your attention... ;-)

2918. Virus on the ST

Message-ID: <9003250646.AA11299@fsucs.cs.fsu.edu>
Source record: 242266

I hope I got the plural of virus right!! ;->

After having to deal with an outbreak of the "Stoned" virus on several of our PC's, I wish to clarify some things that I have heard about the virus situation on the ST (this could be out of date). Is it still true that:

1. No known virus on the ST infects or otherwise screws up a fixed (hard) disk.

2. No known virus on the ST attaches itself to other files, as opposed to the standard bootsector method.

I am getting ready to gear up for a hard drive, and I want to know these things before I start throwing all my stuff on it (some of it european).

Give me a break. I think that Atari (correct me if I'm wrong) is WAY behind
the competition as far as R&D is concerned. They are going down. You heard
it here first. They cannot afford the R&D cash to keep up with current
technology. They didn't even invent the Portfolio or the ATW, they licensed
the technology from the inventors. Where is all that R&D cash going???
Is it going to the improvement in TOS (giggle...heee heee ho ho ho)?
Atari's operating costs are increasing at an alarming rate, yet they are
not producing anything new. (Do I hear violins playing??)

Several people had asked about problems I'd had with Vault and (I thought, Universal Item Selector II)... sorry I wasn't able to reply before this, but I only recently had the time to reconfigure my system to try to duplicate the problems... and naturally, I can't get it to reoccur...

It just may have been as others have reported, that certain combinations of AUTO folder programs conflict, and that my cold rebooting with no AUTO folder programs at all cleared it up...

At any rate, when run that way, Vault worked perfectly...

Interesting stuff...

Just a couple of comments...

Atari *can't* improve the battery life in the STACEY, so they'd decided to DROP battery power altogether. The computer will be a "transportable" versi of the ST, but you'll need an AC power outlet nearby to use it.

A third-party developer is working on a "gel-cell" battery for the STACEY, bu it's going to be a LARGE unit that you'll snap your STACEY into, and it will cost several hundred dollars.

The MEGA line may or may not have "E" style graphics and sound... Atari only informally asked developers how they'd feel about a MEGA with STe style features. IF Atari did decide to produce such a unit, it likely wouldn't hit the market for several years (based on past performance).

The Portfolio may be selling well (by whose standards?) to people who have a lot of money to spend on toys of limited usefulness, but I'd like to see some sales-figures comparisons between the Portfolio and truly useful mini-sized MS-DOS compatibles like the Toshiba line.

The 520ST already *had* its opportunity to "take over the cheap computer market", FIVE YEARS ago, and Atari blew its technological lead. Now, I see people buying $299 IBM PC clones from Radio Shack. It doesn't matter that the ST is technologically superior, if the buying public has never heard of them.

As for the comment that "it seems clear that Atari is entering a new product cycle"... Atari is *ALWAYS* entering a "new product cycle".. Real Soon Now, Second Quarter, by the End of the Year... perhaps Wall Street has caught onto Atari's "Boy who cried Wolf" tactics..?

Hello,

I am having a problem trying to figure out the cause of a crash I am getting on my ST. I originally noticed the problem when I switched resolutions from low to medium and I got 4 bombs. I have been trying to figure out if it is a combination of programs in the auto folder and accessories, but have not been able to determine if there is a conflict or if it is just that a certain number of accessories and programs causes a 4 bomb error. Also, I have noticed that a lot of the time if I switch res with Oat Bran installed, the system will just hang up. Screen white, cursor in the top left corner. I have tos 1.4, a 1040 ST, 2 drives. Has anyone had a similar problem? I've been spending a long time trying to figure out the cause.

Hot off the wire...

HANNOVER, WEST GERMANY, 1990 MAR 24 (NB) -- Despite much press attention, Commodore had no new products on show at Cebit '90. Instead, company representatives were busy showing the company's existing products, including the PC-40, 50 and 60 'III' series, and the Amiga 2500/30 system, first shown at Comdex Fall last November.

Despite the no-show of the Amiga A3000, Amiga users expressed considerable interest in the A2500/30. Newsbytes understands from sources close to Commodore that the A3000 just missed out on Cebit and is, instead, now being readied for a 24 April launch at the Which Computer? Show in Birmingham, England.

Commodore's delay in introducing the A3000 Amiga, due, company sources say to software problems, is in marked contrast to the introduction of the STe series from Atari last Autumn. The STe series had compatibility problems with the original ST series, resulting in Atari having to issue a software patch to allow many ST programs to load on the STe machine.

One Commodore software developer told Newsbytes: "When the Amiga A3000 does appear, its software will be 100 percent stable. They're not going to repeat the Atari's experience with the STe machine."

You might note that Radio Shack just released a $400 "palm-top"
machine which is much more limited than the Portfolio. It seems that
several companies think that there's a market here, and Atari has the
nicest package. Also, the only MS-DOS compatible that's as small as
the Portfolio is the Poquet, which is $2000. The Toshiba is a pig next
to either of them. The Atari (and Radio Shack) gamble is that there is
a market among people who don't want to lug around some huge laptop.

Damn, those Poquets are nice, too. It seems that lots of people have a
lot of money to spend on that toy, when they could spend 1/3 as much
to get the same thing, only heavier and with a better keyboard and a
real floppy drive.

>As for the comment that "it seems clear that Atari is entering a new

>Real Soon Now, Second Quarter, by the End of the Year... perhaps
>Wall Street has caught onto Atari's "Boy who cried Wolf" tactics..?

Yes, but this time they delivered new products (STe, Lynx, Portfolio)
and revenues and income are rising instead of falling. A new product
cycle isn't something a company announces, it's something you can see
in the financial figures. And the financial figures say that revenues
are up.

Well, it does mean the end of my experiments. Unfortunately, you can't
set the ACIA to run at anything between 32.1K baud and 500K baud. (You
can either set the divide value to 64 (~7K baud), 16 (31.2K baud), or
1 (500K baud)). There's simply no way to specify any other divide
values. Oh well...

Who says Oat Bran's not good for ya?

The problem does not seem to be with Oat Bran itself. Try booting with no
accessories and no auto-programs except Oat Bran. Switching resolutions
works fine. (At least for me, and I have TOS 1.4 too.) (Actually, I
tried it with Schizo and DC formatter resident as well.)

I noticed that Quick ST (AUTO folder version 1.46) will cause a warm
boot when you change from medium to low res (I didn't try going from
low to medium). Perhaps this is causing your problem.

Oat Bran doesn't do anything unsafe, undocumented, or unhealthy as far
as I know. It just installs a little routine at the VBI vector.
(I think it's at $70.) After the routine exectues, it jumps through
the old vector (i.e., it calls the system VBI routine).

Be wary of programs like Quick ST and formdial that replace certain
parts of the OS. They sometimes rely on being called first, so if
another program comes before them and steals the vector(s) they steal,
they complain bitterly. The upshot of this is that the order
things get called in is crucial. You may have to erase your AUTO
folder and copy the files back in in a different order (with OS
enhancements first) to get resolution changes to work properly.

Seems kinda funny, remembering how the software issue was inverted from this when the Atari and Amiga first came out (many people became well acquainted with their guru). I'll be interested to see pure stable code on the first 3000!

Message-ID: <1018@uhnix2.uh.edu>
Source record: 242285

The question is why doesn't DC SHOWIT work on TOS 1.4?

Answer: It does! But, it didn't work on TOS 1.6 (STe TOS)

In any case, I am sending a newer version (v1.1) to the binaries group, along
with a DEMO of our new DC DESKTOP program.

2936. Re: Misc: 1040STe , SIMM , AVAILABILITY

Newsgroup: comp.sys.atari.st
Date: 1990-03-25 22:56:03 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <28283@cup.portal.com>
Source record: 242262

Question about bringing in STEs from Canada was asked:
> ... Don't
>Canadian firms do Intl. Mail Order? Anybody have any numbers?

>Could someone purchase a 1040STe up there and send it to Illinois?
>Someone sent a price of $777 Canadian for a 1040STe...

(Darek Mihocka mentioned a Canadian price of $699 when he was here last..)

The simple answer to importing STEs is NO

The complex answer is that with the Toronto Atari Federation show coming up next month, and with Toronto only a fairly short drive from the Detroit area, I was interested in what it would take to *legally* bring an STE back with me. Calling information got me the administrative office phone number for U.S. Customs. Calling that number and explaining what I wanted got me another number. The person there gave me a different number after listening to the story again. Finally I got to someone who understood what I was asking, and gave me some answers. The "Import Specialist" in the field of computers explained that customs duty on computer equipment depends on the country of origin. For the sake of just getting an example, I said the equipment would likely be from Taiwan, for which he said the duty would be 3.9% of the purchase price. (Japanese hardware apparently carries the highest duty) But... this rate applies only to commercial imports. On equipment brought back for personal use, there is a flat 10% duty based on the purchase price, less the personal deduction. (If you just go over to Canada and back, the deduction is only $25.. if you stay 24 hours, the deduction is something like $400..)

So the money part isn't a big deal... but then he said the magic word: FCC

To bring electronic equipment into the US, you must have an FCC form 740 filled out for the Customs inspector. Just by way of an example, the FCC classification number for a desktop computer without a video display unit is: 8471.910090 (every configuration apparently has a different number).

However... he didn't know ANYTHING about hardware that hasn't passed US FCC type acceptance trials, so... he gave me another phone number.

I finally got to the Detroit area FCC office, where the entire inquiry process came to an abrupt halt. You CANNOT bring anything into the US which hasn't passed their testing. The only circumstances under which it would be possible would be if the unit has gone far enough through the testing to see that it is likely that it will eventually pass (which does seem to be the case with the Atari STE), AND that you post a HEFTY bond at the time you bring the unit into the US, certifying that you will have the non-complying equipment modified to bring it into compliance with the

final version.

I don't want an STE that badly...

So, Canadian dealers can't legally ship STEs to the US. Of course, you can always just drive through Customs and try to look innocent... 9 times out of 10 they'll just wave you through... but.. if they check and find a non-complying unit they can impound your new computer and your car, you can be subject to criminal charges, and at the very least, have to pay a fine equal to the value of the computer.

Until Atari US gets the shielding for the STE right, there won't be very many STEs in the US... (sorry that doesn't help you with your dead 1040.. if you can find a dealer with an ST to sell, you probably should buy it, or face waiting until Atari starts making computers again...)

I think the talk of financial health isn't all it's cracked up to be, nor is the talk of what or won't Atari do in the future, as per announced. I think a wait and see attitude is about the only reasonable stance. No, I won't rush out and buy Atari stock (unless maybe it hits <$5 before the TT is out--easy come, easy go) but I'm don't hear the violins yet either.

I think it is interesting that the machine Atari introduced soemthing like five years ago is still somewhat competitive even though it is virtually unchanged. If they do get the legendary TT out I assume that even if it isn't the most technologically staggering display of price per power, it will have the same flexibility as the old platform, and the people who see its potential, however few they may be, will support it until the next computer revolution.

I know for a fact that people are getting tired of paying premium dollars for overpriced toys. Although the Macintosh is popular among college students, the once enthused professors are getting tired of shelling out the kind of money that Apple is asking for for technology that is impressive but for most people meaningless. Granted, they're not rushing to Atari or Commodore, but these machines may get their day.

Eric Ruck

Incidentally, even though I'm hardly overwhelmed by Atari's performance, at this time I would still buy another Mega 2, or recommend a first Mega 2 to fellow college students. I am pleased with the whole system for my modest needs, as the mouse is nice, keyboard feel excellent, and the software (WordPerfect and Uniterm) just what the doctor ordered. And it saves me a few dollars over the other machines.

I don't know why we're all so worried about the future of Atari. Right now, my ST lets me do some decent DTP, read e-mail, word process, and (using MT-CShell) gives me an incredibly cheap platform for developing Unix-like software at home instead of spending too much time sitting in front of an orange monitor under florescent lights. Sure, it's out of date -- so are the Mac, Amiga, and anything which runs MS DOS (I include Windows and MSDOS's messy follower, OS2). There's a new generation on the horizon, which will be so much larger and faster than any home computers that we won't know how we ever got along with only a few lousy megabytes and speeds under 50mhz. We'll have multi-gigabyte HDs and machines running really nice graphic interfaces on top of a (usually invisible) Unix, all for a little more than the price of an ST today.

But it is still today. I've used (and programmed for) MSDOS, and it's a real pain. I like Unix, but I miss GEM, which is very easy to program. I'm ready to dump my mega 2 as soon as I can afford something better, but I'm not ready to whine about it in the mean time. Sure it's cheap. Sure Atari has no future, but neither do car manufacturers. Let's worry about these things tomorrow.

At the risk of boring everyone...

In article <1990Mar23.010055.12116@cunixf.cc.columbia.edu> cmm1@cunixa.cc.columbia.edu (Christopher M Mauritz) writes:
>
>Your posting was rather annoying, as I TOLD you that I was going to send you
>the complete financial report when I got it into computer-readable form
>(which I have just completed today).

Apologies. Chris has been very helpful, giving me some interesting facts in email.

> For your information, the company's
>debt/financial worth ratio is roughly 3 to 1. I would call that HIGHLY
>leveraged wouldn't you?

A companies worth can be estimated in several ways. Atari has roughly US$175 million in debt, US$450 million in sales, and a naieve calculation gives a US$300 million value on the stock market. Yes, the "financial worth" of the company says that it's leveraged. But other analysies of the worth of the company says it isn't very leveraged. What's important is this: even if they kept on performaning poorly, they have enough cash to make interest payments for several years. So they're in no immediate danger of going bankrupt.

>Not only that, but they have been consistently delaying payments to
>their suppliers (not a good sign) and have been REFUSED credit in the
>recent past because of it.

This is true. But this is the way Atari has always been, and their payment record has not gotten much worse recently. They behaved this way back when they had two hundred million in the bank... so this is not something that is getting worse and indicates impending doom.

I do not know what their current cash flow looks like. But they made an operating profit in the 4th quarter of 1989, so you would expect that the cash flow situation is getting better.

> They are MUCH less liquid than most companies
>in their industry and they have a very sluggish turnover in inventory.

This is true, and this is not good.

Also, Chris pointed out in email that Atari's debt rating from Moody's is a B3 - not good. But this was recently re-evaluated and stayed the same. Again, not getting worse.

The fundamental source of the disagreement with Chris and I seems to be Atari's new products. He does not believe they will succeed in the market. I believe they are showing signs that they are already succeeding, given that Atari's revenues were up in the 4th quarter of 1989, the first quarter that the Lynx, Portfolio, and the STe (in Europe) were available. This good news comes after 3 down quarters. I have not seen a breakdown of revenue to see if, for example, ST sales were down... what I've heard suggests that Atari video game revenues were definately dropping.

Atari is definately not going bankrupt soon. Whether or not the stock is a good investment at $6 is an open question.

Cheers!

>are up.

Greg, I must take issue with your interpretation of the facts and figures.
The sales trend for Atari Corp is DOWN. Their "increase" in revenue
does not exist. Sure, their revenue did increase last quarter to
$4 million from an $84 million loss. C'mon, I know you're a big ST
fan, but your standing up for Atari Corp's finances like this is a
bit foolish. Meanwhile, their backoffice expenses are rising alot
more quickly than their "profits." I am not senselessly flaming this
company, but the numbers tell a much different story than you suggest.
BTW, keep your eyes out for Moodys to downgrade Atari's $75 million
europaper from B3 to ???....

Source record: 242286

In article <1990Mar26.044419.11661@cunixf.cc.columbia.edu> cmm1@cunixa.cc.columbia.edu (Christopher M Mauritz) writes:

>Greg, I must take issue with your interpretation of the facts and figures.

Feel free, but be careful of your facts.

>The sales trend for Atari Corp is DOWN.

SALES for the first three quarters of fiscal year 89 are DOWN. Sales for the last quarter, the Christmas season, were UP over 4Q88. Yearly sales were down as a whole.

Sales for the 4th quarter were up, right when the new produts were delivered. Ergo, Atari's new products are selling.

Now, you can choose to quote the yearly figure, DOWN, or you can quote the 4th quarter figure, UP. But please avoid insulting the intelligence of the readers here and tell them which figure you're talking about.

> Their "increase" in revenue
>does not exist. Sure, their revenue did increase last quarter to
>$4 million from an $84 million loss.

WRONG. They showed a $4 million operating _profit_ in the 4th quarter. Profit, not revenue. The $84 million dollars lost last year was due to a $100 million dollar write-off for Federated on top of $16 million of operating profit.

In short, operating _profit_ for Atari Corp, excluding Federated, was down. But 4th quarter _revenues_ for Atari Corp were up. Of course, they need to fix the expense side of the business to make their normal margins.

> C'mon, I know you're a big ST
>fan, but your standing up for Atari Corp's finances like this is a
>bit foolish.

Well, at least I can read financial reports and not totally goof up when it comes time to post. And I make an attempt to specify what I'm talknig about when it comes to trends: quarters, or yearly figures.

> Meanwhile, their backoffice expenses are rising alot
>more quickly than their "profits."

No wonder they fired 15% of the staff. They are watching costs. This is something that Uncle Jack is pretty good at.

If you're going to make claims about revenues and profits, please quote the correct numbers. In order to understand Atari's numbers, you have to watch Federated and make sure you're looking only at the Atari Corp numbers, which is their current business operation. And you need to make sure you aren't getting profits and revenues mixed up. And you need to make sure, when you're wondering if NEW products are selling well, that you are looking the right quarter's results.

Have a nice day.

Chris very nearly admitted I was right a couple days ago that if Atari was going to fold any time soon it would have done it already. Now he says the're going down. Just because they aren't what he wants them to be, he predicts doom.

Again, it is perfectly obvious that with no expectations of any new products and no payoff from R&D, Atari is good for a couple more years. They may even have a VERY good year this year collecting their couple bucks a copy on LYNX and Portfolio. If STacy comes out soon it should at least break even this year. If the TT comes out by mid-Summer, Atari should survive at least 5 more years selling those.

Chris, are you working on Wall Street? I got a couple of market letters that predict a crash, with lots of financial services company new hires losing their jobs.
Steve J.

Some days ago my SH204 hard disk decided not to work with my MEGA ST1 anymore. It does not autoboot, neither can it be read or written with AHDI installed. It strikes me how the boot phase sounds different: in particular, some beeps (the last ones) seem to be missing. I removed the Tandon TM262 drive and plugged it in a PC compatible: Disk Manager, a low level disk utility recognized the drive (610 tracks, 4 heads, 17 sectors) but could not verify any track, just saying something like "SEEK I/O COMMAND FAILED".

Do the more technically inclined among you think that I'd better go out and buy a new drive or is there a chance of repairing the old one ? Could I continue to use my SH204 with its defective Host-adapter by placing inside a Seagate ST157N or ST296N ? Is there any power supply problem ? Or would it be better to keep my Adaptec 4000 controller upgrading to a ST251-1 MFM drive ? Has anyone installed an internal SCSI drive inside the MEGA case ?
If you let me I have some more questions. Which is the best way to upgrade a MEGA ST1 to 2.5 or 4 Mb ? I guess some unpopulated solderless board with 1Mbit DRAMs bought from some USA mail-order service. Are boards suitable for old STs suitable for MEGA ST1s too ? German contributions are welcome.
I am also considering Spectre GCR; I have seen it advertised as low as $200 with Mac 128k ROMs at $124. I would like to know whether there are retailers in North Florida, since a friend of mine is currently in Gainesville, Fl.

I thank you all.

2948. Re: Problems with dutch TOS 1.4

Newsgroup: comp.sys.atari.st
Date: 1990-03-26 12:37:00 UTC
From: MFAGKCHR@HMARL5.BITNET
Message-ID: <9003270806.AA13287@ucbvax.Berkeley.EDU>
Source record: 242292

Hello,

I phoned the shop where I bougt the mega-2 with the dutch TOS 1.4 ROMs,
I wrote about before. They told me atari the ROMs were new. They had
only recently received UK and dutch TOS 1.4 ROMs. These have not been
delivered before. Only sets of six 34 K ROMs are available, so they
had to do some soldering to get these in a mega.

They told me, they had problems with the UK ROMs themselves. In fact they lost
their whole Calamus directory on a megafile 60. They installed the ROMs in a
mega-4 which had worked correctly until then. They had not used the CBHD driver
or Gulam. So I think these programs can not be related to the problem. I
received a megafile 20 from them which had been used with this mega 4 as a
temporary solution (atari does not deliver much in Holland at the moment), the
FAT and Directory structure of that disk had been ruined completely. In fact I
tried to repait this structure using the dutch TOS 1.4 ROMs, and did not
succeed. At that moment I expected the disk to be bad, and send it back.

These problems caused me to resubscribe to the info-atari16 digests
on BITNET. But I'm not sure whether I will receive them. Anyhow,
I have not received many reactions to this problem yet. Please send
important information to me directly.

It might be important to state that the problems are occur very often.
They are not occasional harddisk errors. I do not think that anybody
who does serious work on the ST can have missed them. So, if the problem
is caused by TOS 1.4 it must be an new problem. I do not think that
the previous US and German ROMs contain it.

I did look into the contents of the dutch ROMs. There is some rubish there
like JIM LOVES JENEANE. Is this true for the US ROMs as well? Or did
someone fool with it.

ATARI are you listening? I do not want to start a world wide rumour,
I just want to get rid of the problems. Please send me any info that
might help. I could even send a dump of the dutch ROMs to you, if
that might help.

Exactly what doom are you referring to? I don't think I ever said Atari was in danger of going bankrupt, but they are in danger of continuing to lose money.

>Again, it is perfectly obvious that with no expectations of any new products
>and no payoff from R&D, Atari is good for a couple more years. They may

>even this year. If the TT comes out by mid-Summer, Atari should survive at
>least 5 more years selling those.

Well, as Greg pointed out, that is where I disagree with you (and him). I think these products are a bit too weak to pull Atari out of the hole. IMHO, they need to come up with something a little more interesting to keep current ST owners in the stable and to attract new owners.

>Chris, are you working on Wall Street? I got a couple of market letters
>that predict a crash, with lots of financial services company new hires
>losing their jobs.

Yes, I am working on Wall Street. I am an analyst for a large Japanese bank (about 2 times a large as Citibank, US's largest bank) so I have no fears about my job security at all.

I'll email more financials as they become available to me.

2952. UUCP implementation?

Newsgroup: comp.sys.atari.st
Date: 1990-03-26 14:36:22 UTC
From: wwm@pmsmam.uucp
Message-ID: <1990Mar26.143622.18337@pmsmam.uucp>
Source record: 242173

Has anyone gotten an implementation of UUCP running on the ST? I've tried Mailtruk, but it just doesn't want to work with my host system (MT drops characters at 2400 baud, my host won't accept 1200). I remember someone was trying to get UUPC running, and I even have some source patches to that effect, but my floppy-only system just can't handle a C-compile that big. ARRGH! must be time to either get a hard disk or else get an IBM clone with a hard disk.

In any event, if someone could mail me a uuencoded EXECUTABLE of a working UUPC/UUCP implementation that will run on a 512K ST with one DS and one SS floppy (and will support reliable 2400-baud operation), I would be forever in their debt.

Does a working UUCP exist under MINIX as well? MTC-shell?

Thanks to all for taking the time to read this request!

Source record: 242174

A friend of mine is having problems with running WP for extended periods of time on a Mega ST4. She has GDOS setup using Neocept's driver for and HP DeskJet+. After about an hour of heavy usage, the whole system slows down to a crawl (consistently) and all menu operations/dialog boxes etc. take minutes to process. Does anyone have any clues as to what is causing the problem? Her documents aren't terribly long (about 12 pages each). It seems like the system is bleeding memory somewhere since getting out of WP to the desktop and coming back into WP doesn't help. It requires a full softboot to fix things up. Could it be TurboJet, the GDOS driver? At this time she is only using WP so she can live without GDOS being installed.

advTHANKSance

This depends upon where you are, and where the software you will be using
has come from.

Here in the USA, to my knowledge, both statements are true so long as
you realize that by the time you read this, things may have changed.

Since you mention that some of the software you will be loading to
your hard disk has originated in Europe, neither statement is absolutely
true.

I've heard of, but not received samples of, both link and hard drive
attacking viruses in Europe. Until I have something concrete to base
any opinions on, all I can say is that the possibility exists, and that
you should proceed with caution.

You will find 70 MS to be S L O W. But, then its a LOT faster than a floppy.

Really, you will be happier with 18-28 ms drives, but poorer.

> no dedicated "disk change" signal. So if the original Atari floppy drives

The problem is that ATARI uses the media present information.
If the media is removed, it is detected, and when it reappears, GOTCHA.

But, the same line also passes Write Protect info, so when a disk is write protected, TOS can't tell if its removed (I think I got that straight).

Also, for those who notice there drive select light flickering dimmly:
TOS polls the drives at V Blank time to see if there has been a media change. This requires a very brief drive select.

[stuff deleted]
>* Christoper Roth * "Machines have no
>* InterNet : cr1@beach.cis.ufl.edu * Conscience..."

I have had this problem also. It is caused by desk accessories and/or
auto folder programs. The following programs caused a crash on res
change in my system:

WordPerfect Print Spooler (a desk accessory)

ICD clock setting software (an auto folder programm- sets your clock from
the clock on ICD's host adapter, if you reset the time in the
control panel, the host adapter clock is updated. Note that
there are two versions - the one that does not allow you to
update the host adapter clock does not cause a crash)

EasyDraw Snapshot (a desk accessory that allows you to take screen
snapshots)

It took many hours of removing and reinstalling various combinatoins
of programs to find the culprits. Any one of the above alone is enough
to cause the crashes.

You will have to find the program or combination of programs that causes
the problems on your system, and boot without them whenever you know you
will change resolutions.

2960. Playing Replay sounds in STOS (help!)

Newsgroup: comp.sys.atari.st
Date: 1990-03-26 18:34:11 UTC
From: gregory_a_gladman@sioux.cis.ohio-state.edu
Message-ID: <78456@tut.cis.ohio-state.edu>
Source record: 242180

I just bought both the STOS package and ST-Replay. Both seem like great packages, but I'd like to play back sounds digitized from Replay from games written in STOS. For those familiar with the software: I've tried to load the machine code that came with Replay into a bank with STOS and play the sound that way, but I get a bus error and the machine locks up. I'm using a start address 28 bytes into the routine, since that's what the GFA example uses. Does the routine supplied with Replay use GEMDOS memory functions? Has anyone heard of a way to do this in STOS?

Thanks in advance...
Greg

Hmm, it seems that some of those STacy/GCR demos are starting to attract attention (based on the requests for GCR info from mac users to this newsgroup). Perhaps Dave Small should prepare a file which describes the emulator, and post it to Terminator or somewhere. It could be mentioned in the Intro to Comp.sys.atari.ST post that I have been hearing about (I think this is a great idea).

There is at least one virus on the ST that exhibits a system slowdown as one of it's symptomes. Get VKILLER from terminator, (new version 3.something), and see if that cures your problem. If you cannot ftp, send me email.

>parallel port, goes to a disk file. What does your copy of barrel do?
>--

Ok, maybe I goofed. Let me restate the problem. I have CAD 3D. I also have the CAD 3D drivers and barrel. The output from the CAD 3D drivers is supposed to go to a plotter you have hooked up to your ST. The problem is I don't have a plotter and the software will not dump to a file. What I need is something that will capture the info going to the 'port you hook a plotter to'. I thought this was the rs232 port (modem port) and I thought that people referred to this as the 'parallel port'. The problem could be that the CAD software is expecting return codes from the plotter and barrel doesn't send these.

Does anyone know how to convert CAD 3D files to some normal format like postscript?

Hi,
I'm sort of wondering about Alan Pratt's note that after all, the STE would all come with SIMMs, but then he mentioned all the disadvantages with that. That they were more likely to have problems because of bad connectors etc.
Looking at all new PC motherboards they have SIMMs. I doubt they would have that if it would run unreliable, the only thing that could make it so would be if the board was supplied with extremely low-quality sockets. I hope that is not what he tries to tell us?

Or you could just use the program AUTOSORT, which will do that for you,
without deleting anything. Far as I can tell, it reads up the files into
memory, and writes them down in the correct order (yes, that means order
in the directory, not just create-write, as that could produce different
results). I think I saw it on terminator, could be on panarthea too.

Source record: 242157

If you hate requests for hints on games (especially DM) then hit
next now.

I am playing Dungeon Master for the SECOND time. Why the second you ask?
Because the first time I played the game I found myself stuck at an impass.
I finished level 12 (the knight level) and skipped by Chaos down to off the
dragon. After doing that I assembled the firestaff and returned to the level
above to give 'ol Chaos what he deserved. First however, I killed ALL of the
nast firedemons scrambling around there. Then I went over to get the Hellion
and the other thing from the small ante-room. How you ask? For some reason
the things in the floor resembling tar-pits "turned-off" allowing me to cross
to the other side to get the Hellion ect. All this time, Chaos appears and
disappears, harassing me with poison spells and fireballs. After I have got
the Hellion and the other thing, I return back to the other side of the room
and wait for Chaos to appear. The floor-fire thingys start up again (I have no
idea why they stopped in the first place, out of the goodness of their hearts)?
Now I wait, and wait, and wait,... Hello? Chaos? Where are Youuu? I have
not seen him since. No sign of him, anywhere. What have I done wrong? There
goes a couple of months of play (part time only of course). My girlfried
tended the computer for 8 hours one day while I was at class. Mr No Show.

Well that is my story, can someone help me please? My new party is fast
approaching the same location and I would hate to have the game end the same
way. I would much like the players to go on to CSB which lies on my bookshelf,
still in the shrinkwrap. Please reply by E-mail.

>invisible) Unix, all for a little more than the price of an ST today.

That new generation will be very pricy for a while. I think the real next
generation will be multiprocessorr RISC based small workstations which
cost more than $7000. The fake next generation will be the technological
equivalent of Sun 3/50s and 3/60s. Unlike the MacII, they will be reasonably
priced and have a real OS. They will be designed as scaled down workstations
and not like scaled up micros , unlike all those evil '486 MS-dOS/2 machines.
In all honsty, I don't know if the TT was designed that way, but it looks more
like a "nice" computer than all those clone machines.

The problem with building your own drive is knowing what mechanisms
work. I've had good luck with the Toshiba ND-354, but the 352 gives
me problems. Ergo, you can't just say a company's drives will work.
I'm using both a Teac 3.5 and a 5.25 inch drive on my system, and am
pretty happy with them. I also know that Epson drives are good too.
If you want to upgrade a SS mech, get rid of the PCB board. Buy
a $10 drive cable from Best Electronics, or hack one end off of your
drive cable and put on a 34-pin header for the drive. You can rig
the power supply pretty easily. I've found that eliminating the
PCB solves more problems than keeping it.

By the way: somebody mentioned that they were able to get a Toshiba
ND-352 working by some internal modification. Could you please repost
what you did?

>change status either.
>

There are a number of things you can do to solve the disk change problem. First off, try running a jumper between pins 2 and 28 on the drive's connector. For many drives, this will give you the needed signals for regular media changes.

If that doesn't work because when the jumper is hooked up, you get a write protect error, use a momentarily closed button. Run the wires of the button to pins 2 and 28, and hold the button in when inserting a disk. This will give the computer the media change signals, but will remove the write protect errors when the button is released.

More elegant solutions to this are:

1) Get TOS 1.4: it fixes all the problems be re-reading the disk on every access.
2) A program called FMC.PRG will force media detects, basically doing what TOS 1.4 does. However, it doesn't seem to be 100% operational.

Considering you can set up your own drive for 40% of a "real drive", the money saved more than offsets the potential troubles you'll have.

>

Two Cents. I too beleive atari (at least US) to be in deep.
In fact, I'm not so sure that the whole last 5 years of Nill' support
is simply because atari could care less about the US market. Figuring,
it's a PC land (as it is), and why waste valuable money trying to gain
entry. But, if some poor soul wishes to buy a machine, fine. But dont expect
much. Maybe a tax-writeoff. The Lynx, is another story. According to two
pals a mine, whom bought Amiga's to develop for the Lynx, they cant even
get the developer package. Could it be that atari has no license to this?
If atari were, intererested in making money here, why, preytel, did they
create a Lynx commercial that easily turns off any american parent?
If they want to make money, see the Lynx to Sega say (if they want it).
And it'll go big. I find it VERY hard to beleive that Atari's poor marketing
in the past 5 years in the US is simply an accident. They just keep
danglin' a carrot in front of our noses for a "just in case" market.
Just in case what? I dunno. Maybe UK sales dropping. It cannot be a simple
set of mistakes. AS to atari US future. They have none w/ me. They are
(in my opinion) a HIGHLY non-credible company, that could care less about
me, the end purchaser. And, to use an analogy, Would you buy a car from this
man? Knowing that once you've bought it, he could care less about service/
support. Not I. And, I've heard it for some 5 years. Promises here. Excuses
there. While I like the ST, I cannot justify the purchase of the (still vapor)
TT. You may pay more for apples, but, at least you know they are there for
you. And w/ IBM, they happen to be very very good w/ support. And even if
they were'nt I could rcv all the support I'd ever need elsewhere.ZO}_
In addition, I think I'd be real hard pressed to find 100 competent Atari
developers around. I helped write Deskcart, which, was touted as the best
add on product for the ST at one time. Even fickle Jerry Pournelle liked
it. I made 12K bucks... (Thats stretchin it). Thats SAD, REAL REAL SAD.
Alienating people such as I, Dave Beckmeyer, and others dooms atari.
They were/are all kissy face again. But, "Fool me once, your the fool"
"Fool me twice, I am". IF! the ATARI COMMUNITY, would stand up and SAY
WE HAVE HAD IT!. And mean it. you might see a turn around. Bankrupting Epyx
really upset me. Atari has no right to do that. Especially considering that
Epyx produced fine software, for many machine types, and was around before
atari entered the computer arena. ANY company that claims to be a good
organization, yet blatently bankrupts others has no place at all in this

country. So, Atari, since you support the UK so readily, why dont you just pack up & go there, and let the rest of us get what we pay for from a credible organiztion. Flames to dev\null.

Sounds like it's related to the infamous "phantom typist". Ask your friend to try moving the mouse slightly after each keypress or mouse operation, the next time the problem strikes. If moving the mouse causes the keypresses or menu operations to take effect immediately rather than minutes later, then it's the same problem that many of us have been having periodically with WP and other keyboard intensive applications.

Assuming that it is the same problem, can she really consistently recreate it after an hour of use? If so, I'd really like to know the exact configuration of her system, including order of \AUTO\ prgs etc. Better yet, I'd really like Atari Corp. to know the exact configuration of her system, so that they can finally confirm the existence of the problem, and hopefully do something about it.

Ignac says:
>
> Do you Usenet folks feel that the posting of our demos of our products here
> is a worthwhile endevour, or should we stop?
> Are Usenet folks REALLY care all that much if a commercial endorsement is
> made in the demo??

I feel that software posted on the net should be judged solely on its
usefulness. If usenet people like the damn thing, why deprive us of
a demo simply because it endorses a product? By this logic, we could
censor messages posted by people who work at commercial institutions,
because their content may be construed as commerical, even they just
contain info about how their products work!

Well, since I am happy and satisfied a LEGAL OWNER of QuickST II,
and would strongly recommend the non-demo version without reservations,
my opinion may be biased, but I think I would say the same thing
about any other product - the simple fact is, the more useful stuff which
is available on the net, the better.

To be honest, if his original shareware demo versions were never posted to
the net, I wouldn't have known enough about the product to buy it
in the first place, so it is in a sense, serving the interests of
Branch Always. To this, I say: WHO CARES?

> pass sickeningly long command lines to my own programs too.

MT C-Shell uses the Mark Williams ARGV style arguments, which it turns out
is close to the new official Atari "standard" method (in fact it looks like
it's going to be supported for a while because there are so many pgms
using it). The MWC libraries will automatically understand this extendend
arg format. The ARGV varaible is the last one in the envrionment. The
value of ARGV is the wierd MWC "CCCP?????..." string, which they use for
isatty(), but you can ignore it. After that, the arguments are sitting
in the env., one after another, each separated by a null.

>2) How do I keep MT CShell from adding quotation marks here:
> set copt=-a -p
> program $copt -i${TCINC} $i
> program gets
> '-a -p' -id:\include myfile.c
> instead of
> -a -p -id:\include myfile.c
> I thought that you could set a variable to a list of words, but
> MT-CShell is convinced that it has to be one word.

Yes the variable expands to a single word. The quotes are only added
in the basepage copy of the args (because there isn't another way to
put whitespace in an argument), but the quotes aren't in the ARGV
list. One sort of ugly way to get the above to work is to use back-quotes,
as follows:

```
set copt=-a -p
program `echo $copt` -i${TCINC} $i
```

>
>Thanks DB, or anyone else who can help.

No problem. Please note that you can contact the BDT BBS at (415) 530-9682
for MT C-Shell technical support. This BBS is also available for anyone
and contains a fair amount of general ST stuff (including comp.sys.atari.st).

2982. Re: Question: Indus GTS 100 compat. w. Spectre 128

Newsgroup: comp.sys.atari.st
Date: 1990-03-27 08:44:06 UTC
From: dsmall@well.sf.ca.us
Message-ID: <16894@well.sf.ca.us>
Source record: 242168

The Indus GTS uses an NEC mechanism that tends to filter out Mac data on the innermost 16 tracks (so , first off, most of the disks should be readable to begin with).

This can be cured by shorting inductor L7 and adding a capacitor to change the frequency of the filter to include GCR data.

Complete instructions can be posted (or emailed) upon request; let me know. It's around 5 minutes of soldering and 50 cents of capacitor in parts.

I've been told that "Indus" (okay, it's Future Systems) has switched to a new NEC mechanism that we'll also have to figure out. (what fun). Anywho, the above applies, I believe, to the 1035 mech; don't try it on an 1037.

2984. ** HELP ! ** my ST does not know diskdrives any more !!

Newsgroup: comp.sys.atari.st
Date: 1990-03-27 09:16:30 UTC
From: henk@spex1.uucp
Message-ID: <1018@dnlunx.pttrnl.nl>
Source record: 242170

Who can help me ?
My 520 ST (upgraded to 1 MB) does not recognize disks anymore.
It boots up very fast, gives the desktop screen, but without
disk icons! The floppy does spin for a moment, but nothing happens.
The mouse works, I can get the info-dialogbox for TOS, chance
preferances, probably screen dump as well, but no disk.
My harddisk is nowhere as well.

Who has a clue what to do ?
Is it the disk controller chip? I could not fasten it because it is
soldered already.

Any help is appreciated.

2985. RESET from C, TOS LOAD, QUICK TOS a

Newsgroup: comp.sys.atari.st
Date: 1990-03-27 12:18:52 UTC
From: cs325ec@ux1.cso.uiuc.edu
Message-ID: <16000030@ux1.cso.uiuc.edu>
Source record: 242171

I finally got a Reset to work in the following way for a program
I wrote...

```
#include <stdio.h>
#include <stdlib.h>
#include <tos.h>

long res;

void getrv(void)
{
*(long *)0x426L = 0x31415926L;
res = *(long *)0x4f2L;
}

void main(void)
{
Dsetdrv(2);
Dsetpath("\\AUTO\\");
Frename(0,"HAC.PRX","HAC.PRG");
Supexec(getrv);
Supexec(res);
}
```

Question: Is this the simplest way? Q2: QUICKTOS by Darek M. doesn't
work with an image of my ROMS from $fc0000 with length
192K. Is there a header on the RAM TOS that allows it
to be loaded... Does anyone know the mechanism.

Thanks in advance...

2986. Some hard(ware) questions

Newsgroup: comp.sys.atari.st
Date: 1990-03-27 12:43:00 UTC
From: FALDELLA%BODEIS.CINECA.IT@CUNYVM.CUNY.EDU
Message-ID: <3040@BODEIS.CINECA.IT>
Source record: 242172

Some days ago my SH204 hard disk decided not to work with my MEGA ST1 anymore. It does not autoboot, neither can it be read or written with AHDI installed. It strikes me how the boot phase sounds different: in particular, some beeps (the last ones) seem to be missing. I removed the Tandon TM262 drive and plugged it in a PC compatible: Disk Manager, a low level disk utility recognized the drive (610 tracks, 4 heads, 17 sectors) but could not verify any track, just saying something like "SEEK I/O COMMAND FAILED".

Do the more technically inclined among you think that I'd better go out and buy a new drive or is there a chance of repairing the old one ? Could I continue to use my SH204 with its defective Host-adapter by placing inside a Seagate ST157N or ST296N ? Is there any power supply problem ? Or would it be better to keep my Adaptec 4000 controller upgrading to a ST251-1 MFM drive ? Has anyone installed an internal SCSI drive inside the MEGA case ?
If you let me I have some more questions. Which is the best way to upgrade a MEGA ST1 to 2.5 or 4 Mb ? I guess some unpopulated solderless board with 1Mbit DRAMs bought from some USA mail-order service. Are boards suitable for old STs suitable for MEGA ST1s too ? German contributions are welcome.
I am also considering Spectre GCR; I have seen it advertised as low as $200 with Mac 128k ROMs at $124. I would like to know whether there are retailers in North Florida, since a friend of mine is currently in Gainesville, Fl.

I thank you all.

Pexec does this for you. Its normal mode is :

Pexec(0,...) : loads; starts; frees memory on exit. This is NORMAL.
Pexec(3,...) : Loads; does NOT start yet.
Pexec(4,...) : Start it now, its already loaded. Debuggers use this.
Pexec(5,...) : Lets you do your own loading into a TOS image.
Pexec(6,...) : Like 4, but different memory ownership.

2989. Archive bit

Newsgroup: comp.sys.atari.st
Date: 1990-03-27 13:41:19 UTC
From: forcheck@rulcs.uucp
Message-ID: <645@rulcs.cs.rul.nl>
Source record: 242178

Dear ST'ers,

Does anyone of you know of a program that will talk some sense into
the archive-bit associated with every file? Probably you know what I
mean: in MS-DOS (yuk!) this bit gets set every time the file is
changed, and reset every time it is backed up. In that way incremental
hard-disk backups become a snap.
TOS unfortunalety doesn't do this... This is a real pain as I backup
my SH204 using PC-SPEED & PC tools de Luxe (hey hey!). Sure works great,
I even can optimize my TOS-partitions fine with a MS-DOS optimize tool :-)

So, who can give me a pointer to this (preferrably auto-folder) program
that I feel must exist somewhere? (btw: wasn't this cured in TOS 1.4?)

Kind regards,

Jan Joris Vereijken
forchk@hlerul53.bitnet

2990. Re: Barrel

Message-ID: <90033012502002@masnet.uucp>
Source record: 242184

Several people have mentioned Barrel as a solution to the printer port redirection problem. It only works for small files. This it because it buffers the entire capture in memory before writing it to a disk file. What I need (and I think the other enquirers also need) is a utility that continuously captures printer output and redirects it to a file, repeatedly flushing its buffers as needed, so that file size is limited only by disk capacity. My files are multi-megabyte in size (music scores of large orchestral works) and Barrel just won't do.

Newsgroup: comp.sys.atari.st
Date: 1990-03-27 14:34:52 UTC
From: UPSYF173@DBIUNI11.BITNET
Message-ID: <9003280803.AA09874@ucbvax.Berkeley.EDU>
Source record: 242185

I have problems with TOS 1.4 which may be related to this topic:
1. After a warm reboot (I think even cold boot) the Harddisk driver is
not loaded.
2. I sometimes get an R/W error on the harddisk (which I don't think is
a problem of the disk)
3. Drive A: will sometimes be corrupted (root Directory written into
FAT sectors, as far as I remember).

Installation: SH205, CBHD3.5 Driver, GEMINI installed to autostart.

What helps for 1. and 2. is to turn off the harddisk and turn it on again,
nothing else.

I have some theories about the problems:
1. a virus (I don't think so!)
2. A bad driver blocking the DMA (CLAUS BROD, are you on the list?)
3. A memory allocation failure of the TOS
4. A floppy vbl routine that blocks DMA
5. A critical error handler that does something wrong

The #3 problem may have been caused by me formatting disks under MSDOS,
so that a mediachange was ignored (no different serial numbers in the
boot sector). So I don't complain about that.
But there's another mystery:
After autoboot of GEMINI (which lives in C:\DIV\GEMINI on my harddisk)
the first file selector box will only show the subdirectory; the only
possibility to get to the root directory is to click on drive C, the
closer box does not work.
Anyone else with nice little theories?
Wolfgang

Hi there,
Way back in October 1987, there was a programme around called 'The Graphic Artist'. This was an orientated drawing package which used a 500X500 spreadsheet to store ploting information, coordinates etc.. This means that you can edit, copy, delete or move blocks of cells. You could also enter formulae so that a dimension can be made conditional on some others.

At the time this cost 200, a lot of dosh. Well does this programme still exist, is it public domain yet or shareware, has anyone used it or if not used anything like it????
Many thanks.
Nick
PS Axel, are you still on the planet?
PPS is NIBSC joined the nets yet??

>change in my system:
[stuff deleted]

this is a relatively common problem for accessories which patch vectors.
upon res change, the accessories are reloaded, wiping out the originally
loaded accessory, and along with that, the new patched vector code, causing
multiple bombs. if atari somehow notified accessories that a res change was
in process, then the accessories could unhook the vectors they hooked, and
allow a proper transition from one resolution to another with no bombs.

... more wishful thinking by someone who does a lot of thinking ...

Hello World.

First off, is there a hard drive defragger available for the ST,
preferably something PD?

Second off, we've all heard everyone's opinions on if atari is going
to fold and why they seem to be abusing their users. Such a dedicated
lot we are, aren't we? Anyway, why can't some of these guys who work
at atari who have net access attempt to get an official statement from
atari, maybe even from someone IMPORTANT at atari? To me, Atari seems
to be the single most stupid corporation in the world. (Advertise?
Hey, what an idea! Let's ADVERTISE the fact that the ST can emulate a
mac, ibm, cpm, etc...etc...HEY, maybe an 'Uprgrade your Mac to an ST'
campaign...WOW! WHAT A %$%#$%#@ concept! Ooops, flame off...).

I give up. Oh Great Gods of Atari, WHERE THE HELL ARE YOU?!

Source record: 242188

Hello, Atari16 people:

I have just recently subscribed to this SIG, and the main purpose for this posting is to ask about its offerings. I've been running a 520 ST since Feb '86. It is, obviously, one of the museum pieces--external drives and power supplies; TOS now in ROM but originally on floppy. But it has served me well, especially since I added a 30-meg HD.

My problem is isolation: I'm in a tiny upstate NY town, with no user group or dealers close by; COMPUSERVE is a long-distance call, and it's even becoming difficult to find the Atari-oriented magazines. While I don't need tons of software, it's difficult to escape the feeling that I'm missing out on a lot.

It's therefore good to read other people's notes, and to see hints of demo software and other goodies available through this SIG. But how does a newcomer find out what's available, and get access to it?

Any and all suggestions welcome; feel free to email me directly via BITNET unless you think others might benefit from seeing "the basics" in a general posting. Many thanks.

Michael Johnston

> Are Usenet folks REALLY care all that much if a commercial endorsement is
> made in the demo??

Well, could this problem not be solved (and everyone made happy) if a version was posted to the net that did NOT have the "Available from X at $XX.XX" line? If a substitute was made like "Send email to X or snailmail t Y for more info" would that not satisfy the non-commercial requirement of the net? I for one do not think that a demo should be held from the net just because it advertises something, but I can see where that could get out of control if people abused it. I have always thought that most user text in a program was stored in the .RCS file. A net-only version, if easy to produce, may be the best way to solve this dilemma.

Again, this is IMHO, and I could easily be wrong about the .RCS file thingy.

Usenet isn't a place where official things get said, generally. The
financial information we've been discussing is the kind of thing your
stockbroker gets; No company with a comp.sys.* group posts things
on it that would be seen as an advertisement.

But you will see Atari people here answering technical questions. And
that's very useful for some of us. Thanks, guys!

Of course, if you make a posting here with the attitude of "I'm asking
Atari a question, they should answer me!" you'll probably become
disappointed. This is the newsgroup of the rabble, not the company;
Atari people happen to participate here, but they don't run the group.
We rabble types are happy to comment about just about anything,
though.

Well, we Finns got a glimpse of Stacys. Few of them
are actually here in Finland and are selling (not
more than a couple of dozens).

What I have heard, is that they CAN be upgraded with SIMs.
I remember one reviewer in PCW wondering why it was so
easy to get to memory (just one little cover), memory being
soldered. It seems that Atari had SIMs in mind.

How about HD. I do assemble PCs for my living (just to pay
my studies :-) and I would really like the idea of upgrading
a basic model to full blown 4 MB, 40 MB HD Stacy later on.

Does somebody have more information ?

(I am still looking for prices of Stacy. So far only Sweden
answered my plead. Thanks Ari !)

Well, the ICD utilities include a defragger (I think) and are free. The
catch is that you must own an ICD host adapter to use them (they are
about to come out with a new line of HA's, might want to wait if you
are about to purchase). Also, Michtron's Turbo HD kit includes a
defragger. I do not know which is better, if any.

The next part is a long semi-warm flame, skip now or forever hold your peace.

I am beginning to believe that Atari managment is more dedicated to
making money than making a good product, and then making money. This
is the general trend in American business, and it sucks for a product
like a personal computer because it robs users of much desired support.
I think Atari would move to selling fried pigskins if they thought they
could make a buck. They just do not care that a computer product can
REALLY take off given the proper support, they would just rather make
a quick buck off the sale of the hardware, and let third parties risk
tangling with the wiles and whims of supporting a computer product
(people are notorious for changing their minds for no good reason).
This is the basic difference between a company like (I hate to say it)
Apple, and Atari. Apple does stand behind their products (over-priced
as they are), and does help other companies and dealers do the same thing.
A relationship with Atari starts and ends with the purchase of equipment.
The sad thing is that the product is so potentially marketable, the only
computer coming close in terms of user-friendliness being the $$$Mac$$$.
There are enough people that KNOW that Atari hardware is really good,

very cheap, and has some really good stuff written for it, to make this line of computers a success. But to do this, Atari has to get involved. One thing that would really help would be to somehow get the info that most Atari users learn by expensive trial and error out to the general potential and new buyer: What software is really worth the money! I know that there are many great non-game packages available for the ST (Pagestream 1.8, Neodesk, Michtron stuff, Codehead stuff, GBS stuff, Neocept stuff all comes to mind). The problem is that for every excellent program in every catagory, there are 3 or 4 lemons that would discourage anyone from ST line. Atari should endorse good software (or at least WORKING software), and distribute this info with their computers. Another great idea would be to distribute some high-power PD stuff with them (look at the NeXT, it comes with GNU C!!). There are many PD packages for the ST that completely outclass any comercial product of the same type (Uniterm, IMHO would fit this description). I think that an envelope with about 10 disks full of good PD, shareware, and a working software list (perhaps on an STwriter file, with STwriter of course) should be given away with every ST. They could also include demos of stuff, which would help the new user decide where to plunk his cash down initially (which is the critical time to help people, if they get pissed in the beginning, there will not BE a later for that product). It really annoys me that all the makings of a successful line of computers (empire style) are here: Good machines, good software, good online support (GENIE, etc), enthusiasm of many owners (Atari people have always known that they had some really good stuff, and nobody knew about it. This creates a rather defensive attitude in many, and quite rightly so). Atari has managed to create incredible potential, and then throw it away like complete morons! The funny thing is, they DO still make money, and they are a BIG company. The Tramiels are not at all displeased with the cash they have received for the sale of Atari equipment, because it is a LOT of cash. Thus, for the intended goal (making bucks), they are a success. But they could be a MAJOR success. In other words, I think that flaming Atari for being ignorant of basic marketing strategy is incorrect. They do know, but that is not what they are after. They want to make cash NOW, and have the option of moving on later if Atari users turn fickle and go buy IBM's or something. What they are ignorant of (heehee) is that they are CREATING that situation themselves. Yeesh, enough. This is now a registered book, I am sorry of the length.

Before I send this off, I want to make something clear. This is MY current opinion. It might change in 10 minutes, or I might take it with me to the grave. This is the nice thing about opinions. If you would like to make a comment about my opinion, send it to me. Do not clutter up the net with opinions of opinions. Instead, make your very OWN opinion, and post IT to the net. I am sick of flame wars with old messages indented 4 deep in them. I have seen too many messages get butchered down to a few lines (via reply mode) that no longer carry their original meaning.

>From time to time I've seen mention of replacement floppy drives not indicating
>disk change status. Since I've had a replacement drive for longer than my
>human memory works, I don't recall if the original could really detect disk
>change status either.

Media change is detected using the write-protect line and the disk ID written in the boot sector. It is assumed that this line will go on whenever a disk is removed. Whenever a disk operation is requested, the system determines whether or not the media has changed by the following algorithm: If the write protect line has gone on since the last disk operation and more than a second or two of time has elapsed, then read the boot sector and check if the disk ID has changed. If it has, then a new disk has been inserted. Otherwise, assume the same disk is still in the drive.

Notes: (1) if the disk is write protected, then the boot sector will be reread whenever an operation is performed after the disk has been idle more than a second or two. This is safe but takes extra time. (2) If two disks have the same disk ID, or the write-protect line does not work, then media change will NOT be detected, with predictably disasterous results.

>not theirs.

In light of the recent interest in posting a monthly "Intro. to
Comp.sys.atari.st", I suggest that we also post the following on a
monthly basis, under the title "GENERIC COMP.SYS.ATARI.ST WHINE".
(This is copped from a message sent to me recently by one "mathew"
<smm12@cl.cam.ac.uk>. It's remarkably similar in style and content to
Jeff's post, but I think it's preferable for monthly posting, since it
covers a few more bases. For the sake of thoroughness we should
probably add a few whines concerning Atari's financial health. Oh
yes, and if any other developers or ex-developers have more personal
testimonials concerning how little money their products have made,
that would be helpful too; a little something for everyone. Just
think how much needless typing and banging on the 'n' key and editing
of kill files we could save, not to mention wasted bandwidth, if we
could all just get it off our chest once a month in the form of a
Generic Whine post!! Here's a start:)

"I've not had time to wade through comp.sys.atari.st recently... I get
fed up with all the people moaning - they go on and on about how Sam
Tramiel should be running the country and how Atari don't make good
enough manuals and they don't give their dealers proper support and
why isn't the blitter available yet and they ask why can't I get TOS
1.4 from my dealer and then wonder why nobody answers and isn't it
terrible that they don't advertise in magazines enough and complaining
about the keyboard "it's so tacky..." and if the Europeans can buy an
STe why can't they I mean it's not as if there were any difficulties
in getting them to Canada, not that I want to buy one of course I just
want to see one so that I can complain that Super ZapNarg III doesn't
run on it and anyway the blitter's no good because it doesn't have a
draw-tartan-circle routine like the Amiga does and they told me I'd be
able to upgrade my ST with a Cray emulator for two dollars on a
plug-in card and the Mega ST 2 has been discontinued so now I'll have

to throw it away and buy a new 2MB ST in a different box and of course the TT/P is vapourware I mean okay so people have seen it working in England so what they're probably lying to us just to get us to buy Atari gear and did you see the new Nintendo GameBoy cartridge nowhere near as good as the Lynx but of course you can't buy them because Atari messed up the distribution like they did with the ST and I'm going to have to go to Europe to get a mono monitor and stop off at a pub for a pint of Watneys Red Barrel and (continued in Monty Python's "Travel Agent" sketch)..."

That pretty much sums up the state of the art in c.s.a.s. whining, I think. Suggested revisions?

3005. SHEET New Release

Newsgroup: comp.sys.atari.st
Date: 1990-03-27 20:07:11 UTC
From: tpg@XN.LL.MIT.EDU
Message-ID: <1766@xn.LL.MIT.EDU>
Source record: 242191

I recently received in the mail an offer to update to the latest version of SHEET, a fine shareware spreadsheet program. It's now a 4-in-1 package with a spreadsheet, database manager, graphics, and BASIC interpreter. The offer described the 111 page laser-quality printed manual, but offered little information on the new products themselves.

If you have tried this new version or a 3.0 earlier version, I would like to hear your comments.

3006. Atari TT

Newsgroup: comp.sys.atari.st
Date: 1990-03-27 20:10:08 UTC
From: sarnila@tukki.jyu.fi
Message-ID: <SARNILA.90Mar27231008@tukki.jyu.fi>
Source record: 242192

Well they had the TT in CeBit (also the unix model).
The TOS version (TT030/2) should be available in Germany in May:

- 2M memory
- 40M hard disk (not 30 even they say so)
- VGA monitor
- 6500 DEM (available only in this configuration)

The box is really silly looking.

The unix version (TT/030X)should be available to developers in May:

- 2M (slow) memory for video
- 4M full speed memory (unix will use primarily this)
- HD size not sure yet (at least 80 and propably 120, 170)
- tower case
- either 14 inch (VGA) color monitor (640x480 16 out 4096 colors)
or 19 inch mono monitor (1280x960 mono) (really nice with X)
- price not yet know (round 10000 DEM)

The unix version (ATX = Atari unix) is officially Sys V 3.1 (SVID 2) but
it has really BSD4.3 kernel modified for Sys V. On shell level command
switches are Sys V, but the kernel has also full BSD4.3 syscall interface,
BSD signals (including ones needed for full job control), BSD sockets, TCP/IP,
the BSD fast file system, disipline 2 tty driver (supports SIGSTOP etc. = ^Z).
This gives nearly full BSD compatybility. Csh is the full BSD with full
job controll. Tcsh compiles. Gnu CC (1.36), CC+, gdb, gas are fully ported
(really same as Sun m68k) and officially distributed by Atari. Comes with
NFS and X11.4 (has got 3 button mouse). For developers there comes also the
Hewlett Packard extended XFaceMaker tool kit. Kernel size with basic drivers
+ TCP/IP + NFS 650k. Pager is so customized that it will take pages from full
speed memory first, and only if that runs out, from the slower dual-purpose
(video) memory. As I tryed it out it seemed OK. ^Z really worked. The
(VGA style) display seemed slowish (must be in driver). From a X-terminal
the speed seemed fine. It seems like a nice (BSD) hackers home unix machine
(better then Sys V 3.2/80386). But .... Two buts. 16MHz, it is 1990, should
be at least 25 (it seems that TOS compatibility requires either 16 or 32, for
video shifter to work properly). And the price!!!!. I think far too much to
really compete with 386. It seems Atari really doesn't trust it will sell
in great volume, for the current projected price is clearly a low volume
price. Also it is late. It took so long because Atari wanted also TOS
compatibility. The unix only prototype was ready more than two years ago.
It seems Atari didn't believe a unix only version would sell well enough,
and also they wanted future for TOS line.

3007. Pen pals list (2nd posting)

Newsgroup: comp.sys.atari.st
Date: 1990-03-27 21:53:41 UTC
From: S61304@PRIME-A.POLY-SOUTH-WEST.AC.UK
Message-ID: <9003280804.AA09922@ucbvax.Berkeley.EDU>
Source record: 242193

To *ALL* Atari ST owners worldwide!

Are you interested in becoming involved in a snail mail list of ST users? I know that most of you will be like me and quite happy using the Email facilities at your site, but spare a thought for us final year students who will soon be losing all access to such facilities if the company we join has not got network links!! (Arrgghh, too horrid to consider!). So to get around this I was wondering if any of you would like to help me get a list together of interested parties who could then keep in touch and prevent themselves losing touch with the ST community at large (this would be especially easy if someone who still had net access could summarise current topics or forward news and advice!)

I'm not thinking of anything major league for the entries on the list, just sort of name, address, interests and optionally a few lines about yourself.

eg Simon Chappell.
s61304@uk.ac.psw.pa (goes away after June)
51 Amherst Road, Penny-Come-Quick, Plymouth, Devon, PL3 4HJ. UK.
C, operating systems (UNIX, VMS) & relational databases.

This would be roughly what my record would read, so if you are interested compose something for yourself along the above lines (you can have 5 lines of text about your self if you want! :-) and send it to me either by Email (until June) or at the above address (anytime). I am working now on a list for the UK and when both lists are complete I will Email a copy to everyone that wants one.

I hope that this generates a reasonable level of interest, so don't be shy! Contact me sooner rather than leter and lets all keep in touch! :-)

Regards,

Simon

3008. micro-emacs 3.10

Newsgroup: comp.sys.atari.st
Date: 1990-03-28 04:58:32 UTC
From: depeche@quiche.cs.mcgill.ca
Message-ID: <2657@calvin.cs.mcgill.ca>
Source record: 242194

I use EMACS everywhere, and have about 4 versions on my ST.... I decided
that I would finally get around to making up an emacs.rc file which is
suited to my own tastes. Here is what I want to do

bind-to-key delete-next-character <DEL>

on the version of emacs I have on unix, I type ^? and emacs
recognizes this as the delete key.

on atari st 3.10, this is not recognized. I put it in my emacs.rc,
do describe-bindings, see it listed there, and del still does a delete-left.
I do a bind-to-key delete-next-character and then hit the <DEL> key,
and for the duration of my session, it works fine.
I do a describe bindings, and I see

bind-to-key delete-next-character ^?
bind-to-key delete-next-character ^?

so obviously, the ^? I created in the session and the one in the
emacs.rc file are not the same.

all my problems would be solved if I could do something like this

bind-to-key delete-next-character chr$127

but I don't know the proper format to do it... any help would be
appreciated.

Message-ID: <1308@opal.tubopal.UUCP>
Source record: 242196

In article <6317@umd5.umd.edu> matthews@umd5.umd.edu (Mike Matthews) writes:
]I'm having some serious problems with Uniterm 2.0e (now 002, also with 009).
]The local tie-in I have to the mainframes as, well, gone to h*ll with some
]major line noise problems (it's the only place that gives me line noise, too),
]and Uniterm keeps locking the modem out, such that I have to reboot in order
]to use the modem again.

This happens when UniTerm receives a Xoff (^S) Character. Now the program
waits for the following Xon (^Q) before continuing.
In this case you need to reset the terminal (<ALT>+<F7>) to clear the ^S-
status.

I'd much prefer having a special function on the menu-page to clear the
^S-status, and therefore not loosing the contents of the history-buffer
and any additional settings I might have done...

Simon are you listening?

I heard something about some obscure bug crashing zoo when archiving files
with a certain filelength (multiple of 8192 bytes).
Is this true and when will it be fixed? (I use 2.01/STg)

Also, I use zoo-boy for simple tasks. unzooing is not a task for which
zoo-boy is suitable. The reason? It calls zoo with "zoo x zoofile" when
using the extract-button. What I need is "zoo x.//" in too many cases.
So I end up invoking gulam if I do not-so-simple tasks on zoo-files !

Source record: 242199

In article <1990Mar26.143622.18337@pmsmam.uucp> wwm@pmsmam.uucp (Bill Meahan) writes:
]Has anyone gotten an implementation of UUCP running on the ST? I've tried
]Mailtruk, but it just doesn't want to work with my host system (MT drops
]characters at 2400 baud, my host won't accept 1200). [...]
Are you running MailTruck from within the GfA-Interpreter ?
You might want to compile it for speed-improvement...

]was trying to get UUPC running, and I even have some source patches to that
]effect, but my floppy-only system just can't handle a C-compile that big.
]ARRGH! must be time to either get a hard disk or else get an IBM clone
]with a hard disk.
As the newest version has been tagged 1.0, I might mention a system written
by a friend in Stuttgart which is called Mercury UUCP Modules.

It provides a complete (although simple) Mail & News system for the Atari ST
running under TOS !

]In any event, if someone could mail me a uuencoded EXECUTABLE of a working
]UUPC/UUCP implementation that will run on a 512K ST with one DS and one SS
]floppy (and will support reliable 2400-baud operation), I would be forever
]in their debt.
Don't ask me to send away Mercury UUCP... I only have a test-version (0.926)
and it is not that small. I don't have a fat documentation either.

]Does a working UUCP exist under MINIX as well? MTC-shell?
There is bdt-uucp especially for the MT C-Shell. If you're having RS232-
support in your Minix-Kernel, a portation of Gnuucp should be quite
straight-forward.

Well, out here in Europe we DEFINATELY have link-viruses. There are about four of those, but since some crappy German magazine published a listing of a link-virus and since the utterly disgusting 'Virus Construction Kit' has been out, who knows what kind of viruses are being spread. I don't know about viruses that screw up a hard disk, I haven't encountered any yet. A friend of mine has been on top of viruses ever since the first one was discovered and we have disassembled quite some viruses already.
Get yourself a very good viruskiller (the same friend has written a very extensive one but I shouldn't be advertising) and be very careful with new software.

I recently spoke with Gail Johnson at Atari(Sunnyvale) {development coordin-
ator} and she said that ATARI-Computers and ATARI-Games are TWO DISTINCTLY
DIFFERENT COMPANIES owned by AtariCorp(USA),Inc.

The ST,TT,etc... and 8-bits are handeled thru SUNNYVALE.

The LYNX is handeled thru ATARI-Games division in CHICAGO,IL

The LYNX developers kit has a hefty buy-in at $5000.00(US);
I am told this includes LOTS of stuff--namely PROM burners, etc...

For more information about the LYNX DEVELOPERS PROGRAM, don't bug
those nice, all too patient, people in Sunnyvale--

CALL CHICAGO......Get the number from Directory assistance...

3023. musical entry/score printing?

Newsgroup: comp.sys.atari.st
Date: 1990-03-28 16:44:32 UTC
From: bright@ccu.umanitoba.ca
Message-ID: <1990Mar28.164432.3394@ccu.umanitoba.ca>
Source record: 242062

My wife plays bluegrass and traditional fiddle, and is looking for a program that would allow her to enter music in standard musical notation, play it back on the monitor speaker for auditory verification, and then print out the finished score. Does anyone know of such a critter?

Provisos:
1. It has to run in monochrome.
2. Semi-intelligent entry (keyboard and/or mouse) would be nice, but not critical. I.e., it would be nice if the software itself kept track of measures and the like.
3. Easy editing is a must.
4. Quality of the sound output is unimportant, since the playback feature would only be used to check that harmonies are right and so on.
5. Ability to edit printer drivers would be a big plus, though again not crucial, since we have access to various dot-matrix printers as well as a laserjet.

I haven't paid much attention to the musical side of the ST, so I don't have a clue what's available. I think that something simple like Music Studio is what she wants. Does it run in monochrome? Will it print the final score? What else is available? Any and all facts/opinions concerning availablity, price, quality, ease of use, etc. will be most appreciated. And of course I'll summarize if I get any interesting replies. BBB

Yes MT C-Shell has a supported UUCP, called MT C-Shell UUCP. The
package sells for $49.95 retail. It has uucp file and mail support
and is set uop and run similar to Un*x UUCP, with uucico running
from cron and a L.sys file defining the links. It also supports
two-way use of the same modem (incoming and outgoing calls on the
same line). There is also a scaled-down PD version of news software
available for it from our BDT BBS (415) 530-9682.

>fit into an old 520 ST with an RF modulator and an EXternal drive? Any
>information you send me will be greatly appreciated.

I installed the beast into my 1040st (REV. B). It works great. I had
to cut the power lines to the on board ram to get the thing to work.
That process is outlined in the instructions. Placing the pin grid
board over the MMU is no picnic, patience is a must! You should have
and know how to use an ohmmeter. I cut off the cover of the video
shifter box but the main RF shield was replaced intact. One problem
you may have is that there is a large capacitor in the video shifter
box that might have to be moved (different versions of the mother
board). I moved it by de-soldering it and running two jumpers
to its leads. It is still in the shifter box but now it lays flat.
Would I do it again? Yes!!

I hope this helps
Bill Oswald

Hmmm... I don't have any problems of the sort that you describe, although my programs are different, my system doesn;t slow down to a crawl.

I have a Mega 4, use GDOS, and use Microsoft Write. The documents that I work on are around 50-60 pages, and sometimes I have four documents in memory. I have configured a 2Mb Ramdrive using the Rambaby program (Intersect) and have QSTAUTO (a graphics speedup program), FSELV6 (a file selector) and FOLDR100 in my AUTO folder.

I suspect it might be the driver somehow slowing the system down...

3028. UNIX clone from Mark Williams Co.

Newsgroup: comp.sys.atari.st
Date: 1990-03-28 20:56:07 UTC
From: cs161fca@sdcc10.ucsd.edu
Message-ID: <9365@sdcc6.ucsd.edu>
Source record: 242072

In recent issue of Byte there is an ad of Mark William Co (they made the Mark William C for the ST) for their product "Coherent", a unix clone for IBM for $99.95 (US). It includes everything you expects from a UNIX system, over 200 commands/utilities, lex, yacc, uucp, C complier, etc. Does anyone know if th`at will be ported to the ST?

If you have access to a PC, you could un-ARC, un-ZOO, un-WHATEVER all your
files on your PC and then copy them to a floppy disk and get them to your
ST via sneaker-net. The un-ARCers from the IBM world are (unfortunately)
a little better than those in the ST-world. I have never had a problem
doing things this way, believe-it-or-not (no offense)

3030. CeBIT news

Newsgroup: comp.sys.atari.st
Date: 1990-03-28 22:13:00 UTC
From: UK14@DKAUNI2.BITNET
Message-ID: <"90-03-28-14:13:13.73*UK14"@DKAUNI2.BITNET>
Source record: 242074

A few days ago someone asked for news from the CeBIT-fair
in Hannover/West Germany. I've been there last saturday. Here
are some impressions:
The TT and the UNIX-TT have been presented by ATARI. They told me
that they will start delivering the TOS-machine in June, the UNIX-
machine will be available next fall. Developers can get their
machines in May. But don't forget: That's what ATARI told me, so
let's hope the best.
The battery-problem of the laptop Stacy hasn't been solved.
Tempus Word (a new textprocessor from the author of Tempus) will
not be available until sommer.
Someone told me that the announced delta-module (80386SX-emulator)
will never be delivered ...
Vortex, a German harddisk-distributor, announced an AT-emulator,
based on a 8-mhz-80286. The board which I saw in Hannover has
about the same size as the PC-SPEED-board (no slots, no
co-processor!). Vortex says the ATonce-board (that's the name)
is 35% faster than a 8-mhz-V30-computer (it's not allowed to
compare products in ads in Germany, so they didn't name the
PC SPEED/Supercharger). The ATonce-board has to be soldered
on the 68000 and will cost less then DM 500 (< $250).
A small German company showed a ST-emulator for the Commodore
Amiga - and it works! Most of the standard-software is running
nearly as fast as on a real ST. The QUICK INDEX benchmark reported
a performance of 93 - 98 percent. The price: about 600 DM (< $300).
The 'medusa'-emulator will be available in April for the Amiga 2000,
a version for the smaller Amiga 500 a bit later. You have to use
the original TOS, which is not included with the emulator board.
But you get a program which reads the ATARI-ROMs and saves the
OS on a disk. The medusa-board can emulate the STE, so perhaps
it is the fastest way to get a STE in the US to buy an Amiga
and install the medusa-module ... (just a joke !?).
I hope that all these news are correct (especially the
dates and prices).

>]Mailtruk, but it just doesn't want to work with my host system (MT drops
>]characters at 2400 baud, my host won't accept 1200). [...]

The Atari TOS buffers characters from which MailTruk merely extracts them.
Furthermore, the packet protocol does a checksum on the data packet and
requests retransmission of bad packets. So my question is what makes
you think the problem is character dropping????

3032. Window folder->New WINDOW (TSR)

Newsgroup: comp.sys.atari.st
Date: 1990-03-29 01:31:42 UTC
From: cs325ec@ux1.cso.uiuc.edu
Message-ID: <16000031@ux1.cso.uiuc.edu>
Source record: 242076

So...

What I want to do is write a auto folder program that would intercept the call from the desktop to open a folder (within a window) and create a new window instead of replacing the old one.

Do any of you programmers have any tips that could help me out? Where would I look for the vector to replace?

If anyone out there could point me to some source (C) that contains auto folder programs, I would appreciate it.

Thanks.

Sounds like the toolkit that comes with their C compiler for the
ST less the lex, yacc, uucp. They have long made software for
Coherent systems and PC's ...

Presumably they would port it to the ST if possible.

Timelink, buy the now defunct Batteries Included, works well. It can be
found in the discount bin for $10 (where I got it), and is well worth it.

3036. Help with bit field troubles in Laser C

Newsgroup: comp.sys.atari.st
Date: 1990-03-29 04:33:30 UTC
From: rjd@cs.brown.edu
Message-ID: <34368@brunix.UUCP>
Source record: 242080

I have a bit (excuse the pun) of a problem I'd like some
help with.

I am bringing some C code that I wrote over from a UNIX system which
is trying to do the following:
set up bit fields within a 4 byte word.
union that word to a 4 byte char string and a long.

Essentially, the structure mappings look like:

```
struct phred
{
unsigned long a:20;
unsigned long b:11;
unsigned long c:1;
} ;
```

```
union {
struct phred ieee;
char string[4];
float floater;
} float_guy;
```

This way, when I read a floating point number into float_guy.floater,
I can get at the word in a variety of different chunks...

Now, I've ported this code to a couple of machines, and it works
fine, but, unfortunately...Laser C does not allow bit field assignments
on anything other than unsigned ints, so it chokes on by
unsigned long a:20, etc...

...looking at the K&R language description, it states as one of
the caviats that bit fields should not cross int boundaries, and
an int in Laser C is 2 bytes long.

So, am I screwed, or can you folks suggest an alternative to what
I want to do? (I *hope* so, otherwise I'm in for a *major* rewrite of
my code, and what I'll be left with is an ST-specific peice of
C code...I hate that.

So, any suggestions?

Thanks in advance.....

Do you think .st posters are just the sort of people who whine too much,
or are you prepared to consider the ever so vague possibility they have
something(s) to complain about?

> [stuff deleted]... and how Atari don't make good
> enough manuals and they don't give their dealers proper support and
^^
You think you have problems, here in NZ we have to make out own support.
The NZ distributors make an good effort but you get the feeling they're
keep fairly much in the dark.

> [stuff deleted]... and if the Europeans can buy an
> STe why can't they I mean it's not as if there were any difficulties
> in getting them to Canada, ...[foo]

Well, we can get them here, not particularly cheap though, in case
anyone is interested here are the full retail prices:

0.5Mb STe NZ$1299 Estimated US value: US$647
1.0Mb STe NZ$1599 (Excluding NZ Sales Tax) US$796
2.0Mb STe NZ$1999 US$995
4.0Mb STe NZ$2999 US$1493

Note: These prices include a local (to NZ) sales tax (called Goods &
Services Tax or GST here) of 12.5%.

Any remaining ST's (there aren't many) are selling for NZ$999 inc GST
(520STfm), about US$497 I guess.

I would like to know what prices are like elsewhere, probably a
constructive exercise - if we don't whine to much about the differences.
So if you're reading this and you're not from NZ (a distinct
possibility) then tell us what you local retail prices are - this means
full recommended retail, not street value. If you're in the US, I guess
you should mention which state the prices refer to, and possibly local
tax conditions.

I'll summarise and post any email I get on the subject. I guess any
Atari computer products are valid data, ST's, STe's, Lynx, Mega's, TT's
(:-) but remember rrp, not back-of-truck discount price.

> [stuff deleted]... and did you see the new Nintendo GameBoy cartridge nowhere
> near as good as the Lynx but of course you can't buy them because...

Well, apparently they will be selling NZ wide (NZ's not that wide you
know :-) as of next week (source: this is what Atari dealers have been
told). I'm told only four games will be available and I have not heard
any indication of what the prices will be.

I can't get mail to Dave Small but I receive his just fine. Sorry folks!

Dave,

Thanks for the message about HiSoft. I will contact Ladbroke and see what
plans they have, if any, for supporting existing users of Spectre. I look
forward to getting the latest update.

The Appletalk connection will be fantastic. Is there any possibility of
a native ST program to use it on say a TOPS network with Suns and PC's or
just for networking ST's?

3041. Questions about the STE (compatibility)

Newsgroup: comp.sys.atari.st
Date: 1990-03-29 12:53:48 UTC
From: eric@castle.ed.ac.uk
Message-ID: <3068@castle.ed.ac.uk>
Source record: 242085

Hello!

I am suddenly in the market for a new computer (my five year old 520ST is somewhere in N. America...) and am thinking of getting a 4 Meg 520 STE (mail order prices on the order of 750 pounds sterling including mono monitor, much much cheaper than a Mega 4 -- I'll put up with the non-detachable keyboard for the difference in price :-).

I have a couple of questions for those people that may actually have one of these beasts (expanded or not) in terms of compatibility. I am planning on using:

gulam
gcc
GNU emacs
Sozobon C
TeX (any version)
Minix
and Uniterm.

(talk about impressive assortment of "free" software! [except Minix, of course!)

Has anybody had any problems using any of these with an STE? If so, what kind of problems?

I'd like to hear from anybody that has tried any of the above on an STE, whether it worked or not. Please email and I'll summarize for the net.

Also, what would people suggest as the best buy (based on quality and price) for a reasonably large (60-100 Mb) hard disc in the UK?

Thanks,
eric

PS - I don't care about Atari's financial situation. :-)

I dumped the incoming data lines to a file and examined them.

On the workline request (always!) the control byte seemed to be missing.
MT loops forever looking for a valid packet.

The system I'm connecting to is an HP9000/825 HP-UX 2.1. This host moves
about 3 MB of news a day over a Telebit T2500 plus makes other UUCP connections
so I'm sure that the host end works properly :-)

Coherent is a complete multitasking Unix-like operating system, not a
toolkit that runs on top of an existing operating system. It looks to me
as if it's being positioned as a more reliable alternative than Minix and
a less expensive option than Xenix and the "real Unixes."

$99.95 is a darned reasonable price, and a big cut from the $495 they used
to charge. If Idris or the complete version of OS/9 had been marketed for
the ST at that level, they might actually have sold a few copies.

I'm not going to hold my breath waiting for an ST port of Coherent. I
expect the Mark Williams Co. has better things to do than write oddball
early-1980s-style software for an unadvertised, erratically marketed and
usually unavailable computer.

MW> Sounds like the toolkit that comes with their C compiler for the
MW> ST less the lex, yacc, uucp. They have long made software for
MW> Coherent systems and PC's ...

Nope, Coherent is a real Unix clone. Not as fast as QNX, but much,
much more Unix like. I don't think MWC was planning a port to the
Atari.

In K&R C, bit fields are only guaranteed for the type unsigned
(i.e., not unsigned short or unsigned long, just unsigned). Compilers
which allow other types are extensions to the standard.

>So, am I screwed, or can you folks suggest an alternative to what
>I want to do? (I *hope* so, otherwise I'm in for a *major* rewrite of
>my code, and what I'll be left with is an ST-specific peice of
>C code...I hate that.

In their book, K&R comment that the way a compiler deals with bit
fields can vary from compiler to compiler. Specifically, it may
start listing the bit fields either from the left or from the
right. Hence bit fields are inherently machine specific. They
are normally used to access some sort of machine specific hardware.

The only way that you can GUARANTEE portability would be to use
an unsigned long (integer, NOT bit field) and use bit masks and
the bit operators to manipulate your data. (Granted, this isn't
as simple as bit fields are but it is more likely to be portable.)

3046. 32-Bit compress for TOS

Newsgroup: comp.sys.atari.st
Date: 1990-03-29 17:18:22 UTC
From: dietrich@fromuu.UUCP
Message-ID: <0142322@fromuu.UUCP>
Source record: 242090

Hello,

is a 32-bit compress for TOS available?
We (hi Rodney :-) need it for a News-System.

Bye

Dietrich

This is not Uniterm fault. A component of your received line noise is Xoff if
Xon does not come the ST wait forever for it so you cant send.
Fix ? Set uniterm to use no handshaking ... for the most part at 2400 baud
you dont need it anyway. (esp if you have 512 k rx buffers like me :-)

_I have seen no problems with the Euro roms. (British at least)
Your problem possibly stems from an incompatable auto or acc program
Please do not start rumors, it is highly unlikely there is the problem
you describe. Look at other sources first.

PS as for the Junk , yes it is there one wonders if atari could elliminate
line F by removing this :-)

You could try installing G+Plus instead of GDOS. This should result in a
speed increase.

> > Does anyone know if that will be ported to the ST?
> Presumably they would port it to the ST if possible.

A long time ago (at least 18 months) I remember Daniel Glasser, at
that time an MWC employee [I believe; corrections solicited]
mentioning that MWC had ported Coherent to a slightly-modified 1040.
The mods involved building a little MMU (the chip Atari calls an MMU
is more of a memory controller than a memory _manager_) from MSI logic
to enforce interprocess memory protection and to do dynamic relocation
(i.e., every user task believes it has memory starting @ 0 or some
other small fixed value, and can't write to system or other process
memory spaces).

I believe they decided that the product wasn't marketable, which is
sad since Minix-ST has shown how much hackers would like a small Un*x
clone for the ST platform. Perhaps we could persuade MWC to release
schematics and/or a board layout for their MMU? I would gladly pay
two hundred dollars or so for one, if it gave me (say) base-and-limit
registers for User I&D plus Super I&D - four base-and-limit pairs
would be adequate. Another one or two or three to handle DMA accesses
and/or interrupt vector fetches and/or video accesses would be nice
but hardly nescessary.

Daniel, are you still out there? Any chance of this? I'd settle for
just a schematic. This would be lots of fun even without Coherent;
MMU support could be stuck into Minix without too-too major surgery
I think. It would be a lot of fun.

BTW, I don't mind carving on my ST because I don't really care whether
it runs or not. I am moving to a used Sun 3/50, and taking my SCSI
peripherals with me, Uncle Jack can stick that in his "TTx" pipe and
smoke it :-P. The TTx is two years late and 50% too slow, 16 MHz
indeed. If Atari had just stuck to its knitting (designing, building,
and marketing _computers_) instead of fiddling around in the LBO arena
and getting *burned*, both they and we would be far better off IMHO.
But hey, who ever listens to the customers? With luck, maybe MWC?!

One such program is EZ Score Plus from Hybrid Arts (213) 841-0340.

It runs in mono, offers good scoring capabilities, and supports 9 and 24-pin dot matrix printers for output. You can hear what you've scored through either the Atari built-in speaker or a MIDI device.

Although for just scoring purposes you can run EZ Score Plus standalone, I use it in combination with the EZ Track sequencer software, also from HA. This lets me input a song from a Midi keyboard (which, in my case, is an el cheapo but goodo Casio CZ 101). For me, this is a faster and more natural way to get notes into the computer than entering them by hand from within EZ Score. I use EZ Track to quantize my uneven playing to, say the nearest 1/32nd note. After that, EZ Score Plus reads the sequencer output, and does the scoring automatically.

I only wish that EZ Score would support the HP Deskjet. Does anyone know of a scoring program that does?

wwm@pmsmam.UUCP (Bill Meahan) writes:
>On the workline request (always!) the control byte seemed to be missing.

I don't know why the control byte is missing, but I am pretty sure it is
not a speed issue. As I say, the TOS buffers incoming characters.
MailTruk merely uses a bigger buffer. There should be more than
enough buffer room for control messages and packets.

One thing you might want to check is to make sure MailTruk and your
modem are NOT flow controlling! XOFF-XON should be disabled in both
your modem and MailTruk (about line #20 in MailTruk, 3rd xbios parameter
should be zero.)

Control bytes often look like xoff/xon characters, thus screwing everything
up as they are stripped off the message!

Any idea how much they would cost?
The price seems to be a secret.
Is it that they don't want to hurt ST sales?
Or is it that thr price is not good?

As far as I can tell the unix box wont be competitive unless it costs
less than $2000 with 4Mb RAM, 40Mb Hard disk and Color monitor.
(without the software (unix))

>difference.. maybe this is the market for which ATARI
>is demonstrating NOTATION sofware ..interesting marketing idea...
>a little backward maybe ;-)

>ACTUALLY... ridiculous blunders like this make a big difference...

You're right. It does look kind of strange. I noticed it the first
time that ad was run in KEYBOARD. But the way I looked at it was that
it kind of showed off Notator's ability to put those *nicely drawn*
notes on screen at however many notes below the staff one requires.
True, they could have hit "S" to invoke the staff splitting facility
but the guy probably thought it was "really neat" (uh-heeyyuh!).
Still, the ad is great and I think the intent of it was
to show that the STacy was every bit an ST by showing it running a
"big" program like Notator along with its optional Unitor/N plug-in.
It didn't make much difference to me since I was just floating with
being able to see a nice clear, non-spy-quality, photo of my next
computer purchase (I use my ST for music and I've waited since last
summer for it).

From: krieg@jupiter.uucp
Message-ID: <2402@mrsvr.UUCP>
Source record: 242202

Can someone please tell me how I have to configure Uniterm to get Xmodem or Ymodem to work? I've been using Uniterm since one of the earliest versions and even with the documentation, I haven't figured it out. I want to transfer files between my ST and a Sun running Sun OS/Unix. How should I set these parameters for Xmodem to work?

RS232 Settings
Flow ?

File Transfer Settings
Accept ASCII Null ?

Buffer Settings
File Transfer Buffer size in Kb ?

These seem to be the only 3 I don't know how to set, but I may be forgetting something. If anyone has been able to use Xmodem, please let me know what your settings are or e-mail me your UNITERM.SET file.

For what it's worth, I am using the Xmodem 3.6 on the Sun side. I have been able to use it flawlessly with the built in Xmodem in the Mi-Term program.

Thanks for any help.

> (mega2) motherboard?
> Peter

Both the time problem and the TIME.INF file are due to the NEWWORD desk accessory. It seems to ignore the system time clock and somehow uses TIME.INF to set GEMDOS time. This problem in itself forced me to abandon NEWWORD; an otherwise excellent program. If there is a newer version, I don't know about it. In short, it's not a hardware problem. Just disable the newword accessory and reset your clock with CONTROL.ACC or something.

Yes, it is possible. Some time ago someone posted a program
named Gulamfix. I just checked the panarthea index but it is
not there. So it must have shown up in comp.sys.atari.st.

Gulamfix reads your national keyboard map and takes the
original GULAM.PRG as input. It then generates a patched
version, GULAMNEW.PRG.

Source record: 242206

With regard to some recent descussions about UniTerm:
(Well I.m on BITNET, might not be so recent)
1) Use of the hold screen function does also send an OFF (and XON after
a key press) This is much faster than a reset.
2) If somebody really has a version newer than 2.0e 009 he should not insure
it but distribute it

>different versions? I put in 5 patches in it that I found in a German magazine
>and they work - meaning the machine code is at the same position in most of
>the EPROMs, so.... That's as far as I know.

I tried the same 5 patches from the German ST computer magazine in the
problematic dutch TOS ROMs (that is before I found out they were problematic).

I found that the code for the so called shell-find patch was shifted
about 200 bytes. So there are differences between the dutch and the german
ROMs.
Mind the problems occurred with the original, unpatched ROMs. The dutch
and UK versions (both seem to be problematic) have become available
only recently.
There were more strange things in the ROMs, except the love declarations
stated earlier (the other one is something with "Dave StaUgas loves",
I forgot who it was.
- The country code seems to be one bit wrong. (i.e 13 while according
to the an article in that same magazine it should be 14. 13 is the
suppossed to be the code for saudie arabia. May be atari does not
know the difference. (Remember: oil is from Arabia the tulips come
from Holland).

N.B. The patches are meant for less important things than the harddisk
problems I described. Two of them are also present in the TOS14FIX program
from atari.

To make TeX.ttp you need the files:

plain.fmt (see below)
virtex.ttp
undump.ttp

Make TeX.ttp by execution of:

undump tex.ttp virtex.ttp &plain

To make LaTeX.ttp you need the files:

lplain.fmt (see below)
virtex.ttp
undump.ttp

Make LaTeX.ttp by execution of:

LaTeX.ttp: undump latex.ttp virtex.ttp &lplain

To make the plain.fmt file you need the files:

initex.ttp
plain.tex

Make plain.fmt by execution of:

initex plain\dump

To make the lplain.fmt file you need the files:

initex.ttp
lplain.tex
lfonts.tex
hyphen.tex

Make lplain.fmt by execution of:

initex lplain\dump

Posting the binaries of TeX.ttp or LaTeX.ttp is not very attractive
since they are 712680 bytes a piece...

3066. Re: Questions about the STE (compatibility)

Newsgroup: comp.sys.atari.st
Date: 1990-03-30 14:44:44 UTC
From: chad@norge.enet.dec.com
Message-ID: <9799@shlump.nac.dec.com>
Source record: 242210

I also have a question about STe compatibility.

Will C-labs Notator run on it (the STe)?

And if a European buys the US version of Notator and takes it back to
Europe (Finland) will the US dongles work on US machines (are there
timing problems?)

Thanks

Chad

3067. Gulam Question

Newsgroup: comp.sys.atari.st
Date: 1990-03-30 15:32:56 UTC
From: m_t@sioux.cis.ohio-state.edu
Message-ID: <78667@tut.cis.ohio-state.edu>
Source record: 242211

I'm writing a script for gulam, and can't figure out how to
remove the extender from a filename. I can easily get
all of the filenames that end in .arc for example, by:

foreach fn {*.arc}

but then how does one extract the base name (ie get test from test.arc)?

I want to build a directory without the extenders.
I've tried set fn $fn-'.arc' and it doesn't work.

help would be appreciated ...

Thanks, Mustafa

<this message on a Mega2 ST that's been upped to a Mega4, am running
<System 6.04 on my Spectre GCR (version 2.3), and am in MultiFinder.

I have a 1040STf with Tos 1.4 that has no trouble with 6.04. I am running GCR with a Syquest 44 which leads to me question. I took one mof my disks which was partitioned into 4x11meg groups. I ran Spectre.prg and converted them to HFS partitions and when I go into mac mode only 3 show up. Anyone know whats going on?

As a side note: I am thinking of starting a GBS mailing list. Anyone interested?

3069. Re: Problems with dutch TOS 1.4

Newsgroup: comp.sys.atari.st
Date: 1990-03-30 16:26:00 UTC
From: MFAGKCHR@HMARL5.BITNET
Message-ID: <9003311624.AA18243@ucbvax.Berkeley.EDU>
Source record: 242213

IN%"root@bunyip.cc.uq.oz.au" writes

>_I have seen no problems with the Euro roms. (British at least)
>Your problem possibly stems from an incompatable auto or acc program
>Please do not start rumors, it is highly unlikely there is the problem
>you describe. Look at other sources first.

The problem is I did check all I could think of. I did not use anything
but the programs I described. i.e. CBHD driver, occassionally TURBO ST
(1.6) and Gulam started from desktop.inf and the TOS14FIX.PRG from atari.
No other auto folder or acc program active. Problems even occurred
without Gulam. I checked the problems with dlii and SED, both gave many errors.
The problems that occurred in the shop were not related to CBHD or Gulam.
I know of a lot of people who run the german TOS 1.4 with these programs
without problems.

There was one special thing using these disk checkers. The FAT compare
functions sometimes gave errors. If I recheckt them they did not always
give the same results. This might indicate that the FATs are not always
read correctly. I do not know why. I do not say that this must be a
TOS 1.4 problem. I just can not think of another cause. I did not see
any data errors on the harddisk. If a file was found correctly the contents
was also correct. Errors only occurred in the FAT and directory contents.
(Which is about the worst place). I did rebuild the disk using another
mega with TOS 1.2 installed. I did check intact programs, including
the most used things like Gulam and SEDT, with Sagrotan. No virus found.

What I would like to know:
-Did anybody have the same kind of problems? (I was already informed
of one case, with US ROMs).
-Has anybody been running the dutch or UK ROMs, who is sure he
does not have the same kind of problems. (I.e. at least run a hard disk
checker that would indicate lost and cross-linked clusters), while he
did do much movement of large files on the disk, and with many open
files?
-Is there a hardware explanation. Is there anything in the hardware that
could fail and give this kind of errors? The mega that gave the problems
here was a new machine, it just might have given the same problems
with another TOS version.
-Is it possible to install the ROMs in a wrong way? Can it be that the
shop just did a poor job in the installation(s). Since they told me
that problems had also occurred with a used mega-4 after the ROMs
were changed, I think this would be a more likely explanation.

I would be very glad with a definite idea. I have an expensive new
machine here, which I would like to use. In fact we NEED it.

3071. Internal Drive Problems

Newsgroup: comp.sys.atari.st
Date: 1990-03-30 17:08:56 UTC
From: bgrave@umn-d-ub.D.UMN.EDU
Message-ID: <3303@umn-d-ub.D.UMN.EDU>
Source record: 242215

I own one of the old Atari 1040st's (this one has the RCA tv output plug in the back of the machine - that's how old) and I am having a problem with my disk drive. It's a Chinon internal 800k drive and it is slowly dying on me. About a year ago I bought this Chinon brand new from a dealer in the twin cities because my old one croaked. Now this one is going. I was wondering if anyone out there has any suggestions for a new internal drive.

I've heard that the Chinon drives are crappy, but this is nuts!

Replies much appreciated.

Brian

3072. For Sale: Mac Hardware, Amiga Software

Newsgroup: comp.sys.atari.st
Date: 1990-03-30 18:33:49 UTC
From: markv@kuhub.cc.ukans.edu
Message-ID: <22668.2613522d@kuhub.cc.ukans.edu>
Source record: 242216
Cross-posted to: misc.forsale,comp.sys.amiga,comp.sys.atari.st,comp.sys.amiga.tech

I posted this once to misc.forsale, but after a few people committed
and then reniged, these items are available again. Some general notes:

Prices include parcel post or book rate in Continental U.S. (except for the
drive mech, thats + actual cost of shipping.) Other methods or overseas are
price+shipping_cost. Payment in U.S. dollars please. I think that
covers it.

Hardware:
(These items were purchased when I thought I was going to buy AMAX the
AMIGA Mac emulator. They can be used by Mac owners, Spectre (Atari
emulator), AMAX, or any of the Mac laptops that need ROMs. The drive is
mostly useful to a Mac owner, but will work with AMAX given the right
cabling.)

Sony 800K 3.5" Mac Drive Mech - $125 / b.o.
(Drive mech only, no cable or
enclosure. DOES have a SE/
II/IIx internal bracket)

Mac 128K ROMs (B/C Revision) - $100 / b.o.
(These are the 128K ROMs that
fix the SCSI bug that was
in earlier versions.)

Amiga Software:

Superbase Personal - $ 40 / b.o.
(I got Professional now...)

Balance of Power - $ 25 / b.o.
Balance of Power Book - $ 10 / b.o.
Book + Game - $ 30 / b.o.

UMS (Univ. Mil. Simulator) - $ 25 / b.o.

BAAL (Psygnois Game) - $ 20 / b.o.

Test Drive II - The Duel - $ 25 / b.o.

Mindshadow (Text w/Pics adven) - $ 15 / b.o.
Borrowed Time (" ") - $ 15 / b.o.

Defender of the Crown - $ 20 / b.o.

Books:

Inside the Amiga (1st Ed.) - $ 15 / b.o.
Programmers Guide to the Amiga
-Vol I. - $ 20 / b.o.
-Vol II. - $ 20 / b.o.
-Both I and II - $ 35 / b.o.

If you are interested let me know. I'll consider barter for most of the
Games as the reason I am selling them is I've played through them and am
looking for new challenges. Well, for now,

Cheers,

Message-ID: <5330016@hpccc.HP.COM>
Source record: 242218

> I only wish that EZ Score would support the HP Deskjet. Does anyone know
> of a scoring program that does?

I have used EZ Score with my Deskjet+ and the Epson emulation
cartridge, which I believe is $80-100.

My results have been a little uneven. The Deskjet cartridge emulates
a different model Epson printer than EZ Score supports, and I've seen
spurious horizontal lines dropped near the top and bottom of the page.
It's also tricky to get the paging right.

HOWEVER, I wouldn't be surprised if there was a way to work things
out. I just bought EZ Score because I got a really good deal on it,
and figured I might use it some day. So far I haven't really needed
it, so I haven't taken the time to study all the software and printer
configuration parameters enough to try to fix things.

Plus, this is not to say that the output is bad -- just a few
glitches. The Epson cartridge also gives you a few additional fonts
(elite courier and an Epson proportional space font).

Most bizarre. Mine works under 1.4 just fine. Works on a Mega2+2 as
well, and even with a 16Mhz accelerator (talk about *update* rate and
smooth flying!).

The 16Mhz accelerator and Spectrum512 are not very happy with each
other, though. Sigh.

Just another Atari ST user (finally retired my old 512 from the "first
batch"),

From: rvanzuylen@letitb.enet.dec.com
Message-ID: <9838@shlump.nac.dec.com>
Source record: 242222

System release 6.0.4 works fine with Spectre; I've been using it for months. The only problem is... THE SYSTEM ALWAYS THINKS IT IS RUNNING ON A MAC 512KE MACHINE even if I force the Spectre to emulate a Macintosh Plus. This causes some dumb incompatibility problems. Apple must of changed the way the system determines what type machine it is running on in 6.0.4 (and up.) HOPEFULLY, the new release of the Spectre software (2.65) fixes this problem. It is probably a trivial problem... something just isn't set right.

DAVE??? :-)

--Ron

P.S.: I'm going to be installing 6.0.5 soon... wish me luck. :-)

I was at a friend's friend's house (did you get that?) today and saw a pre-release demo of the Atari ST Emulator from Germany!! It works!!! It comes into TOS and allows you to change between all three screen modes (lo,med,hi). Best of all, unlike a real ST, this allows you to use the 640x400 hi-res mode without having a separate Monochrome monitor!! This version did run a few programs (BASIC, LOGO) but died when trying to run color-graphics oriented programs (Neochrome specifically). I feel that this is only a case of it being such an early demo version. However, it allows you to use any amiga drive to read/write ST disks! The screen was slower than a real ST but I feel that also will get faster and would really cook if you had an accelerator!! Hope this gives you all goose bumps and gets you excited about the eventual release of this program. Think, the amiga will be the only computer in existence that can run Amiga, IBM, Macintosh, and Atari ST software not to mention UNIX when Commodore gets their !#@ in gear.

At "terminator", the ftp server, the file "keyfix.arc" is in
the directory "unindexed".
At panarthea, the mail server, see "volume3/keyfix".

I don't know about your file in particular, but I frequently catenate text
files using "Gulam" on my ST. Some examples of the usage are

```
cat a b c > output
cat stuff.* > junk
```

When I download a big file from a the net to the ST, I use UUE on the
VAX and then use UUD on the ST. This usage of UUD makes it unnecessary
to catenate the pieces before decoding.

3086. Amiga/Atari help

Newsgroup: comp.sys.atari.st
Date: 1990-03-31 15:01:19 UTC
From: jkain@silver.ucs.indiana.edu
Message-ID: <40345@iuvax.cs.indiana.edu>
Source record: 242230
Cross-posted to: comp.sys.atari.st,comp.sys.amiga

Greetings-

I am a current Macintosh user and am selling my Mac and plan to buy either an Amiga or an Atari ST. I have been trying to find information regarding these computers from the net and from magazines at the bookstores, but I haven't been able to find anything both objective and accurate. My questions are as follows:

1- Is there an Amiga system with a 68030 microprocessor, capable of running a real implementation of UNIX?

2- Is there an Atari ST system with a 68030 microprocessor, capable of running a real implementation of UNIX?

3- Do either of these companies offer discounts to college students (even if their campus micro-supplier doesn't carry these lines)?

4- And if there are no educational discounts, where would be a good place to buy these computers for cheap (comp.sys.mac suggested trying the local supermarket, but I haven't had any luck at Kroger ;)

5- Any additional insight you could share would be greatly appreciated.

I've used an Atari 1024 (? I think that's what it was) in the assembly language class here at IU, and was rather impressed with it's capabilities and especially its potential. The only experience I've had with an Amiga is a friend with an Amiga 500 and a bunch of video games.

Thanks for the space -

Jeff Kain

beroll@ecs.umass.edu writes ...]

> Hello,
> Thanks for all of the replies helping me getting on to an ftp site.
> (although no one mentioned that you have to put "anonymous" in quotes")

That seems to be a "feature" of the FTP user interface on your end. I had no trouble connecting with terminator.cc.umich.edu and logging in without the quotes. Your email suggests that your site is running VMS, not Unix, and you may encounter some unexpected behavior as a result.

> Now that I'm in, how can I download something? All of the files are in
> standard form, not binary. When I try, everything gets garbled and when I un
> arc it, it messes up (i get 2 bombs).

This definitely belongs in the "most frequently asked questions of comp.sys.atari.st" file.

FTP tries to be helpful. By default, it assumes a file is text and tries to translate it into a canonical format -- which mangles binary files.

The files on Terminator are binary files. Anything with a .arc, .zoo, .lzh or .Z (Unix compress) suffix requires special handling.

The FTP commands "type binary", "type image," and "set binary" all mean the same thing: change the default to image mode. That will allow the transfer over the Internet to proceed without any translation. Try "help type" for an explanation.

Once the files are in your local Internet-connected host, it's a good idea to look inside them by running arc v <filename> or zoo v <filename> if you have those programs available. No sense in downloading damaged files to your ST.

Then you have another hurdle to jump. Moving the files into your ST can introduce another layer of destructive reformatting. Kermit and Zmodem in particular may decide to alter the top of the file or remap '\n' into '\r\n' throughout. You should check with your system administrator or a knowledgeable local user about potential pitfalls that may be unique to your site.

In the worst-case scenario, you can uuencode the data on the big computer, download it in ASCII format, and uudecode it on the ST. Then you can unarchive it normally.

Yes. The hardware is there now. The Unix (Sys V Rev 4) is not here yet, but
should be before long. The hardware you want is an Amiga 2500/20 or 2500/30,
which are nothing more than Amiga 2000s with 2620 or 2630 plug-in accelerator
cards. I don't know what a minimal system for running Unix will be, but it
should be in the order of 4-5 megs, with about 70-80 megs of drive (depending a
lot on your idea of 'minimal'), and a streaming tape unit. When Unix is
released, there will be a configuration sold 'ready-to-run', and I don't know
what provisions will be made to allow an A2000 owner to take the plunge.

>2- Is there an Atari ST system with a 68030 microprocessor, capable of running
> a real implementation of UNIX?

I really don't know. I have not heard of one, but then I don't follow Atari
products.

>3- Do either of these companies offer discounts to college students (even if
> their campus micro-supplier doesn't carry these lines)?

Commodore curently offers an educational discount. I don't know how long it
will be in effect. The prices I heard sounded excellent.

>4- And if there are no educational discounts, where would be a good place to
> buy these computers for cheap (comp.sys.mac suggested trying the local
> supermarket, but I haven't had any luck at Kroger ;)

<sigh>. No, you won't find Amigas in supermarkets. You will find A500s in some
of the 'consumer electronics' stores, but you are better off buying from an
authorized dealer.

>5- Any additional insight you could share would be greatly appreciated.

The Amiga is a fast, capable machine that multitasks right out of the box,
using its own proprietary OS (Amigados). Next to an Atari 520ST or 1040ST, it
is impressive. Add in a 2620, 2630 (or even one of the third party
accelerators), and overused words like 'awesome' come to mind.

When Unix arrives, the Amiga will be capable of running Amigados or Unix at any time, in addition to the other OS's that will run on it now (IBM PC(lone) stuff, Mac, and if reports are true, Atari 520/1040 stuff).

>I've used an Atari 1024 (? I think that's what it was) in the assembly
>language class here at IU, and was rather impressed with it's capabilities

About all I can suggest is to find a user group or a knowledgeable Amiga owner in your area and have a look. If you were impressed by the Atari, you will be doubly, nay, triply impressed by the Amiga.

I hope I've been objective enough. It isn't easy for an Amiga owner.

There is one forthcoming, or so I've been told. I don't recall which model it is, maybe the 3000 or something like that. Somebody else, help me out if you can. I think it will run System V

Commodore DOES offer discounts to students. If you want a list of them, I will see if I can find mine and send it to you. Just send me E-mail a the address under my signature.

Both machines are pretty good. The advantage of the Amiga is its multitasking capabilities. I use it ALL the time. I have no doubt that some of the people in the Atari lists will be able to give you advantages of the ST. I believe sound is one of them. It has a built in Midi-interface, whereas the Amiga doesn't. However, the amiga has MOST of the hardware used by the Midi interface, including a UART. I used one of the PD schematics and built my own, and it works like a charm. It only cost me about $12 US if I recall. Unfortunately, this ties up the serial port, but with an Amiga 2000, I believe you can add more serial ports.

Another advantage, pertaining to only the A2000 and above is the internal slots. Some people may not find this an advantage, but I do. There's room for hard drives (The A2000HD has one already) and a number of other slots, including one for the IBM bridge board, so you can run PC software. I like the tried and true PC method of add ons, with the exception of jumpers.

Both machines have a number of software emulators. The ST has one for the MAC and the PC. The Amiga also has both, but the PC emulator is not very good. Hopefully, somebody will improve on it. I'm not even sure if it's available any more. As interesting news, I just read about a program under development that allows an Amiga to emulate an ST. It's nowhere near complete, but it's apparently coming along nicely.

If you have any other questions, just email them to me.

Good luck choosing,
Chris Everhart

Currently, the 2500/30 is available, running a 25 MHz '030 and 68882 on
an accelerator card. The Amiga 3000, with 030 on the motherboard, is
expected to arrive pretty soon but nobody knows for sure... it hasn't
even been "officially" announced yet.
All Amigas w/030 or '020 + MMU should be able to run the upcoming
release of Unix System VR4 for the amiga (I believe it will come with
open look and X-windows).

>2- Is there an Atari ST system with a 68030 microprocessor, capable of running
> a real implementation of UNIX?

The Atari TT, with 16 MHz '030, has been shown for a while by Atari, but
as far as actually shipping it, don't hold you breath. As far as I
know, there is no other '030 option for the ST series. Atari is working
on a version of Unix for the TT but I don't know which version or what
stage in it's development it has reached (the Amiga's seems to be very
close to being finished).

>
>3- Do either of these companies offer discounts to college students (even if

Well, you could try to remove the power switch itself, and spray it full of WD-40. It is a constant amazement to me that most problems with computers are of a low-tech nature. When I have to fix something, the first thing I do is rip it apart, vaccum out all the dust, clean contacts with an eraser, jiggle the cables, and put it back together. This cures all problems about 90% of the time.

If you can, you should also check the springiness of the contact itself. It is possible that by bending it slightly (if it is of that type, I have never looked inside an ST, even mine!). Just be careful, and DO NOT USE THE WD-40 TRICK ANYWHERE NEAR THE COMPUTER. If you cannot detach the part, just clean it as best you can, with compressed air and perhaps a dab of rubbing alcohol. Check to see if actuating the switch moves any wires in the machine. If so, check the solder contacts on the end of those wires (the slightest jiggle,

repeated many times, can fracture a solder joint)

3093. 10 ugly bombs (again)

Newsgroup: comp.sys.atari.st
Date: 1990-03-31 19:09:58 UTC
From: rachna@cbnewsm.ATT.COM
Message-ID: <10877@cbnewsm.ATT.COM>
Source record: 242237

Is there really no one amongst all you distinguished net.atarians
(atarites?) who knows what 10 bombs mean. Or am i just being
ignored. On the chance that my origonal artical didn't get out,
let me try again.

I have a 1986 or thereabouts vintage 1040 st with tos1.0 (i think)
in rom, and an atari sh204 20 mb hard drive. recently i have
started getting this strange problem every time i try and run
flight simulator 2, where the machine dies with 10 bombs on the
screen. This happens wether i try and run it from my hard drive or
from a floppy.
However, when i boot the machine with the origonal disk
as the boot floppy, every thing runs fine.

I am having this problem only with this one program, everything else
runs fine.

I have sent for the vkiller.220 program from the panarthea archive,
though the fact that this problem occurs even with the origonal floppy
which has been sitting in a box all these years, and only with this
one program, makes me wonder if this is indeed a virus.

If any body has any inkling of what's going on, i would very much
appreciate any suggestions. please send me mail or post to the
net as you find convenient.

Rodney Volz (rodney@merkur.UUCP) - I hope this is correct) has
written a very good UUCP implementation for the ST called ,,Mercury``.
I don't know if he read this group so I write:

- rn (simple news-reader)
- pnews (news-poster with forwarding)
- mail (small-mail with paths)
- rnews (receive news --> 16 bit compress)
- rmail (receive and send mail --> use paths)
- uupoll (calls your host to specifed time)
- variable baud-rate (I use 1200 and 2400)
- and some more ,,unix-like`` options

Bye

Dietrich

Hi people!

I need some info about Word-Up 2.0 or 3.0. I really want to get a new word processor with more versatility than 1st Word. I have some questions, though.

1) What are the differences between v2.0 and v3.0, and are the differences big enough to warrant the extra $20?

2) Will either version run on 512K 520STfm with a Single Sided Drive?

3) To those of you who have it, are you happy with it?

4) Does it support Star NX-1000 printers?

I would very much appreciate any replies!

Thanks.

HOBBS!

3102. The reasons for my position on demos

Newsgroup: comp.sys.atari.st
Date: 1990-03-31 23:30:46 UTC
From: koreth@panarthea.ebay.sun.com
Message-ID: <35429@grapevine.EBay.Sun.COM>
Source record: 242246

There have been many comments here recently about my policy on demos on comp.binaries.atari.st. I'd like to take this opportunity to explain my position, so everyone will at least know where I'm coming from.

I have several problems with posting blatantly commercial programs to the net, but there are two that very much outweigh the rest. The first, and probably most important, is that several of the networks which transport comp.binaries.atari.st have usage rules which prohibit the networks from being used for profit. The NSFNet backbone of the Internet is the largest example; I believe that BITNET also has such a usage rule, though I'm not certain.

The usage rule exists because the NSFNet (I'll use it as an example, though this applies to others as well) is funded largely by the federal government, which put it in place to facilitate communication among researchers working on government-sponsored projects. The sponsors of the network want to keep it as empty of other traffic as possible, so that when a legitimate user wants to send his physics simulation results to a colleague, he doesn't have to worry about the net being bogged down by fifty zillion copies of an ad for company X's new program.

Strictly speaking, if a site transmits unauthorized data over one of these networks, its network connection can be severed by the sponsoring agency. That rule isn't very strongly enforced, largely because for the most part, everyone behaves pretty well and doesn't abuse the net. If, however, lots of big commercial programs start filling up the net, and someone complains about it formally, the powers that be will have no choice but to enforce the letter of their law. It is mostly for this reason that I want to keep blatantly commercial programs out of comp.binaries.atari.st.

The second reason is along the same lines, but it applies to uucp sites. Watching this discussion, I saw lots of people say that they liked the demos because they were free. Not so. The users on a system may not have to pay, it's true. But the uucp network involves a lot of long-distance phone calls by a lot of people. Rn is right when it says that each article costs hundreds or thousands of dollars to distribute worldwide. Now, say your company makes CAD systems. Are you going to want to pay twenty dollars in phone bills to help distribute a demo of your competitor's new CAD program? Probably not, but by the time you have enough of it to see what it is, you've already paid for it. I consider that a fairly rude practice.

Anyway, those are my feelings on the subject.

3103. MONOCHROME MONITOR BLUES

Newsgroup: comp.sys.atari.st
Date: 1990-04-01 00:03:59 UTC
From: Z4636947@SFAUSTIN.BITNET
Message-ID: <900331.18035836.016151@SFA.CP6>
Source record: 242247

Hello netters. I'm new so please be gentle. I have a monochrome ST monitor that is just over a year old. I baby my equipment and am scared to open anything up, using my 1040ST for desktop publising. My monitor died just yesterday and a local tv/repair shop said that it was a flyback transformer. He had some phone numbers for Atari repair centers and included a number for a company called Best Electronics. He does not have the transformer in stock and neither do the other places.

Another STer here said that his monitor went out on him recently and his finding was that he would have to trade his monitor in and pay $130.00 for exchange!!! But he said that there are no monochrome monitors anywhere in the U.S. and ended up borrowing a multisync monitor which he is not happy with (Mitsubishi DiamondScan) because it is too fuzzy in as a monochrome monitor.

My questions are these: is there any source for ST monochrome parts? If not, are there any monochrome monitors SOMEWHERE? If no ST monochrome monitors, is there a good substitute which offers the same sharpness. I'm hurting. I really need this computer. I was in hog heaven with it until this year old monitor died.

Thanks in advance!!!

From: david.megginson@canremote.uucp
Message-ID: <90040213364447@masnet.uucp>
Source record: 242249

rjd@cs.brown.edu is absolutely right about the limits on bitfields in C: a bitfield may _never_ be longer than an unsigned int in any C implementation -- I believe that this applies to ANSI as well as K&R C. The native int size for the ST is 16-bits -- that's what the OS functions look for on the stack, etc., etc., and code with 16-bit ints will usually run faster than code with 32-bit ints on a 68000. However, there are at least 2 ST C compilers which use 32-bit ints to make porting Unix code easier:

1) Lattice C -- not a great package, but they have released some improved versions.

2) Gnu C -- free, and upgrades always upcoming, but you need a 2 meg machine (or more...). Get version 1.36 or higher, if 1.37 has been ported yet.

I was wondering if someone could answer two technical questions:

1.) 50Hz: Setting 0x448 to something other than zero does not
put the ST in PAL mode, does it? I downloaded hertz.arc
from terminator, but the hertz.tos is non executable,
i.e. no 0x601a... I have seen both a boot sector program
and a PD 50Hz program, but I can not find them now that
I need to disassemble them.

2.) Starting up a disk that has an executable boot sector:
How? I've tried loading in the sector and jumping to it...
(I know, stupid idea). I disassembled it, but after going
into supervisor mode ala trap 14, it has an illegal instruct.
I've tried jumping to the vector in 0x47a but that accesses
the disk momentarily and quits. Anyone have any ideas?

(P.S., yeah I know, shut off the hard disk and press reset!)
but I would like to do 1. and then 2.

Any info greatly appreciated. Thanks in advance. -- Greg

3108. Flight Simulator bombs - solution

Newsgroup: comp.sys.atari.st
Date: 1990-04-01 06:44:19 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <900401.00441835.016202@SFA.CP6>
Source record: 242102

anil pal writes of problems with using Flight Simulator on the
hard drive or when trying to run, not boot, it from floppy.
The solution is to deselect all accessories and programs in the
C:\AUTO\ folder. Flight Simulator is really jealous about what exists
prior to its loading. Some programs conflict with it, some don't. Deselect
your programs easily with SuperBoot 6.0 or any of the other program select
utility programs that are on the net.
The bomb definitions can be found in most language manuals. The following
comes from GFA Basic 2.0's manual:

2 bombs - BUS ERROR
3 bombs - ADDRESS ERROR
4 bombs - ILLEGAL INSTRUCTION
5 bombs - DIVISION BY ZERO
6 bombs - CHK EXCEPTION
7 bombs - TRAPV EXCEPTION
8 bombs - PRIVILEGE VIOLATION
9 bombs - TRACE EXCEPTION

Nothing is listed in this particular manual for anything above
9. Note that somewhere on Panarthea is an interpreter for the bombs,
gving the memory location and what the error is. Also, if you run
NeoDesk, there is an interpreter of the bombs.
I hope this helps.

Laserbrain, a PD Epson emulator for the Atari laser, is available from various
PD houses (I think Current Notes has it in their library). I do not know if
it emulates graphics capability.

I always ftp .arc files in binary mode, and have never had a problem. If this
does not work, try tenex mode (type 'tenex'). This takes care of some weird
word lengths on some machines.

3112. Atari/Amiga help

Newsgroup: comp.sys.atari.st
Date: 1990-04-01 07:11:17 UTC
From: jkain@silver.ucs.indiana.edu
Message-ID: <40395@iuvax.cs.indiana.edu>
Source record: 242106

Greetings-

I am a current Macintosh user and am selling my Mac and plan to buy either an Amiga or an Atari ST. I have been trying to find information regarding these computers from the net and from magazines at the bookstores, but I haven't been able to find anything both objective and accurate. My questions are as follows:

1- Is there an Amiga system with a 68030 microprocessor, capable of running a real implementation of UNIX?

2- Is there an Atari ST system with a 68030 microprocessor, capable of running a real implementation of UNIX?

3- Do either of these companies offer discounts to college students (even if their campus micro-supplier doesn't carry these lines)?

4- And if there are no educational discounts, where would be a good place to buy these computers for cheap (comp.sys.mac suggested trying the local supermarket, but I haven't had any luck at Kroger ;)

5- Any additional insight you could share would be greatly appreciated.

I've used an Atari 1024 (? I think that's what it was) in the assembly language class here at IU, and was rather impressed with it's capabilities and especially its potential. The only experience I've had with an Amiga is a friend with an Amiga 500 and a bunch of video games.

Thanks for the space -

Jeff Kain

Aaron Roydhouse of New Zealand asks:

>Do you think .st posters are just the sort of people who whine too much,
>or are you prepared to consider the ever so vague possibility they have
>something(s) to complain about?

Nooo... it's against the Atari Cheerleader's Code to even consider that
possibility...!

>So if you're reading this and you're not from NZ (a distinct
>possibility) then tell us what you local retail prices are - this means
>full recommended retail, not street value. If you're in the US, I guess
>you should mention which state the prices refer to, and possibly local
>tax conditions.

Unfortunately, if you're in the US, there's the distinct possibility that
you CAN'T find any Atari products to buy...

If you call around within a radius of several states, you might find a
dealer with a 1040 to sell.. (not MAILORDER.. OH NO>>! Atari won't sell
via MAILORDER>>>!! Maybe they'll "SHIP" you a 1040... if.. you can find
a dealer who HAS a 1040 in stock, that is...)

So.. how DOES a company survive with NO products to sell, and NO dealers to
sell those (nonexistant) products...?

> a real implementation of UNIX?
Well, yes and no.
There is a 25 MHz Amiga 2500/30 with 3 megs of ram (2
megs 32 bit, 1 meg Chip ram) and 68882. It has all the hooks to run Unix
but the software isn't out yet. It *SHOULD* be released withing 30-60
days.

>3- Do either of these companies offer discounts to college students (even if
> their campus micro-supplier doesn't carry these lines)?

C= offers hefty student/educator discounts (about 40-50%) A 2500/30 w/
40 hard drive (and 2 meg Ram sockets) 25 MHz, IBM At (8 MHz) bridgeboard
with 1.2 meg drive, monitor and 1 3.5" drive is $3,700. For about $400
more you can emulate a Floppy based Mac+.

> supermarket, but I haven't had any luck at Kroger ;)
They're not at the local Wegman's yet either.. :)
>
>5- Any additional insight you could share would be greatly appreciated.

I forsee rain today, cloudy tomorrow with Tuesday having a high degree
of humidity. Wednesday will be clear and sunny. But then again, you're
not in Rochester.. :)

>is a friend with an Amiga 500 and a bunch of video games.
Play with both machines for a long time before you decide. I don't know
much about the ST, so I want say anything about it. From what I read
about the new machines, they sound nice (although I don't like the ST's.
Having 2 monitors bugs me).

I have an Amiga 2000, and love it. A few suggestions though:
If cost isn't much of a problem (as I suspect, if you want an '030
machine)
For No Mac Emulation: Get the A2500/30 bundle. It contains the Amiga
2500 with a 25 MHz 68030 & 68882 with 3 megs of ram: 1 Meg for
Video/Sound/General and 2 megs of REAL fast 32 bit ram. It also has the

a2091 HD controller with 40 meg auto-booting hard drive. (and sockets
for 2 megs of RAM). Also included is an IBM AT (Hardware) on a card
running at 8 MHz with a 1.2 Meg floppy (and can use the hard drive also)
and a decent monitor (1084.. ok, but I prefer a multisync. Work out a
deal with your dealer, my suggestion). This costs $3700 w/o Multisync.
See your dealer for details on the Discount program.

If you DO want Mac Emulation, get:
A2500/30 CPU
IVS TrumpCard HD controller & 40-80 Meg Hard drive
A-Max utilities (By IVS makers)
A-Max Package (ROMs, software, and floppy drive (if you want))
Multi-Sync Monitor (Nec 3D, Mit. Diamond Scan, and Princeton Ultra-Sync
are all great)
This set-up will allow you to use: Amiga w/ auto-booting hard drive,
Mac Emulation with the hard drive (& optional Mac Floppy, if you
need to transfer software, otherwise, it's not necessary), and have
a VERY fast machine that will accept Unix when it comes out RSN.
This will cost a little more (get best prices.. shop around), but will
be an incredible system.`

As a side note, I hear there is an Atari ST/STE emulator in the works.
If true, you could get this machine and run: Amiga, Unix, Macintosh,
IBM AT, and Atari ST software from 1 box. All but the latter is already
out and runs nice. (sorry, Unix, isn't out JUST yet, but has been
showcased running X-Windows)

> and a PD 50Hz program, but I can not find them now that
> I need to disassemble them.

I looked at that file too, and also could not get it to work. I wrote up
a small program to do it for me instead:

; program to set 50 Hertz color video mode
syncmode equ $ff820a
palmode equ $000448
sshiftmd equ $00044c

.text
clr.l -(a7)
move.w #$20,-(a7) ;Super
trap #$1
addq #6,a7
btst #1,sshiftmd ;Are we in color?
bne.s quit ;nope, go quit
bset.b #$1,syncmode
st palmode+1
quit: move.l d0,-(a7)
move.w #$20,-(a7)
trap #$1
addq #6,a7
clr.w -(a7)
trap #1
.end

For your purposes, you can omit the call to Super, as I believe the boot
sector is already in supervisor mode when it's executed.

>

Well, if you're into disassembly anyway, why not diassemble your ROM, and find out where it's disk boot entry point is?

Looking thru my BIOS listing from the ST Internals book, I see that all the ROM routine does is test if the sector is executable, and then JSR to it. Then it does an RTS. Seems like what you describe should have worked. Why don't you just jump thru the reset vector for a cold boot? Append the couple bytes worth of code I listed above to the relevant boot sector, and go.

The best place to look is Mac archives. One archive that has some interesting stuff is sumex-aim.stanford.edu. You'll find sounds there in info-mac/sound/ but you'll have to un-binhex and unstuffit them. (Unix utilities to do this are in info-mac/unix/)

I've extracted the data from most of these files and could upload them to terminator (for use with newbell) if there is sufficient demand. The folks running terminator would probably want to make a new directory for samples, since I've got quite a few.

Any takers?

It just occurred to me: this may be the well-known Mega/EPROM
problem. TOS 1.4 was originally released as a 6 EPROM set, but
the Megas use two higher density PROMs. So, when the six EPROMs
were installed, a driver chip ("SGS" 74LS373) that was marginal
before ran out of oomph. Solution was to replace the faulty driver
with a higher power unit (74AS373).

3125. ETHERNET on the ST: A Summary of Information

Newsgroup: comp.sys.atari.st
Date: 1990-04-02 06:02:10 UTC
From: kruel@vax.rz.uni-wuerzburg.dbp.DE
Message-ID: <125
Source record: 242132

Dear networkers,

2 weeks ago I asked about the availability of ETHERNET cards for the ST.
Thanks to all who posted info's to me.
Without claiming to give a complete overview, here is some summarizing
information:

--< begin >----------

1. PAM's ETHERNET
=================

- Hardware:
- IEEE 802.3 based Ethernet card,
- connected via the DMA port, ROM port or Mega ST bus
- Thick- and ThinWire adapters (15pol. SubD and 50 Ohm BNC)
Transceiver on board for use with ThinWire
- contained in a seperate metal box (DMA and ROM port version only)
- own power supply (DMA and ROM port version only)
- max. length of cable: thick: 500m, thin: 185m
- 64kByte Cache RAM
- 48 Bit node ID can be stored in an EEPROM

- Software:
- TCP/IP with ftp, telnet
- ftp works with appr. 100kByte/s
- bsd-socket-library available (optional)
- VT52 emulation
- VT102 and Tek 4014 available (optional) = PAM's TERM
- NFS in preparation

- Prices:
- Ethernet card: ..... DM 1698.-
(DMA version = "PAM's NET/E
Mega ST bus version = "PAM's NET/Emega
ROM port version = "PAM's NET/Erom)
- TCP/IP software: ..... DM 298.-
- VT102 + TEK 4014 (PAM's TERM) ..... DM 398.-
- NFS ..... app. DM 700.-
- Discounts:
10% for universities for the hardware, multiple licenses for the
software upon request.

I saw it working on the CeBit with a VMS-MicroVax. Seems to be a quite
stable solution. The software runs under GEM.
Non-TCP/IP-connections (Atari-Atari, Novell) are available also.

Address: PAM Software
Carl-Zuckmayer Str.27
D-6500 Mainz 33
FRG
Tel. +49 6131 476312
Fax +49 6131 476402

2. BioNet 100
==========

- Hardware:
- IEEE 802.3 based Ethernet card,
- connected via the DMA port, DMA in/out
- Thick- and ThinWire adapters (15pol. SubD and 50 Ohm BNC)
- contained in a seperate metal box, 34cm x 34cm x 4cm (approx. the
size of the Mega ST)
- external power supply

- Software:
- TCP/IP (based on the ka9q package by Phil Karn)
- telnet, ftp, smtp; net spooler
- crash recovery system
- network security system (access limitations)
- VT100 terminal emulation (Tek 4014 optional)
- works with any terminal emulator (e.g. Uniterm)
- UDP library

- Prices:
- Ethernet card: ..... DM 1745.-
- TCP/IP software: ..... DM 450.-
(includes the above listed features)
- Discounts:
for universities, institutes, schools upon request.
multiple licenses available at reduced cost.

I also saw this working on the CeBit. Several reference installations
can be listed. Software for homogeneous Atari-Atari-networks is
available also.

3. Atari
========

- Hardware:
- Ethernet card for the Mega ST bus (fits in the bus adapter and the
slot left at the back of the Mega ST)
- Thick- and ThinWire adapter (15pol. SubB and 50 Ohm BNC)

- Software:
- TCP/IP
- telnet, ftp

Prices:
- Ethernet card: ..... appr. DM 1000.-
- TCP/IP software: ..... appr. DM 600.-

Availability: "Real soon now after the fare [CeBIT]", as Mr.Mester,
Atari Corp., Germany, stated.

I myself saw the card itself, but no installation working. As Mr.Mester,
who is responsible for the TT and TT/ATX at Atari in Frankfurt, stated,
"he has a lot of these cards in his room waiting to come to sale just
after the fare". We'll wait and see ...

Address: Atari Computer GmbH
Frankfurter Strasse 89-91
D-6096 Raunheim
FRG
Tel. +49 6142 2090

4. Further information:

I saw this product connected to the TT/ATX on the Hannover fare. Both ftp
and telnet appeared to work. Refer to the above address or Atari itself for
details.

b) Mr.Tyler IVANCO <S=tyler;OU=stpl;O=ists;P=cdn;A=telecom.canada;C=ca>,
writes:

<...>

5. XWindows for the ST
======================

XWindows is available for the ST. On the fare, it has been demonstrated
on the BioNet card. It is alleged to work with others also.
It has been developed originally by Mr. Gehret, Groenenbach, FRG, and now is
distributed by Atari.

Features: - X11.2 port (don't know if X11.3 is finished now, or if they
just hop to X11.4)
- Xserver/client mechanism is based on standard TCP/IP calls.
- FTP and TELNET within a window possible
- runs on the standard monitor (SM124) and on 19'' screens
(here: MatScreen)
- screen size is virtual and can be adjusted freely

A really working version was presented on the CeBit. Moving windows seems
to be a bit slow; screen updates in the windows is done using a jump scroll
mechanism.

Price: appr. 600.- DM per licence,
available through Atari (real now), or directly via:

X/software Michael Gehret
Silcherstr. 15
D-8944 Groenenbach
FRG
Tel. +49 8334 1001

--< end >-------------

[Disclaimer: I do not work for any of these companies now have I relations
to any of them. I made this summary for informational use only
to my best knowledge and conscience. Correct me if I'm wrong.]

Prices are in DM. Currently ratio of the DM to the US$ is appr. 1.73 DM / US$.
Ordering from outside the FRG will give you back 14% V.A.T. Add your local
resident tax + postage.

Best regards,
Thomas.

From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <28523@cup.portal.com>
Source record: 242115

Paul Zwan asks:
>Has anyone ever tried upgrading a Mega 2 (late 1987) to 4 MB. ?

IF.. your Mega 2ST has the printed circuit positions for the extra RAM chips, then an upgrade to 4 Megs isn't toooo hard. It requires carefully sucking th solder out of allll the RAM positions (18 pins times 16 chips) plus the decoupling capacitor positions (16 capacitors times 2 leads each). Then you solder in 16 sockets and plug in your new RAM chips..

If you've got one of the "redesigned" Mega 2ST boards with no extra positions, then Atari has you by the balls.. you have to trash your Mega 2ST and buy a new Mega 4ST... the "Atari Upgrade Path"

Welcome to the Atari way of doing things...

BobR

3129. Two quick questions...

Newsgroup: comp.sys.atari.st
Date: 1990-04-02 07:53:11 UTC
From: jamesl@CIE.UOREGON.EDU
Message-ID: <9004020753.AA21852@cie.uoregon.edu>
Source record: 242136

1. Does anybody know if it is possible to rig up some kind of battery backup for the RAM on an ST? Not necessarily a long-term backup, but something that would cover short outages, like a minute or so.

2. Are there any anonymous FTP sites around that have ST software? I'm kind of stuck in the middle of nowhere as far as PD stuff goes, so through the net is my only hope.

Thanks for listening...

Correct me if I am wrong... Having just done a 2.5 meg upgrade to my
1040, I had to trace almost all the lines on the board, but it seemed to
me that Vdd and Vss were contigious with many other chips. i.e. if you
tried to place a 5V source across them, it would be eaten quickly. I forget
what is in our ST's, static or dynamic RAM, and for that matter, I forget
which eats more power (see what U of I computer engineering teaches you).

FTP try these:
ftp -i 131.211.80.5
ftp -i 128.252.135.4

3134. Hard disk incompatibility with old TOS?

Newsgroup: comp.sys.atari.st
Date: 1990-04-02 13:15:05 UTC
From: ogorman@espoir.hasler
Message-ID: <1238@hslrswi.UUCP>
Source record: 242137

A colleague has problems using a new hard disk with his old Atari ST:

* 1985 version of TOS boots from disk, not ROM
* booting with new hard disk installed, error messages:
this hard disk driver may not work with a disk-based version of TOS
files on your hard disk may be damages
hard disk driver not loaded

Questions:
* has this got to do with the TOS version?
* can an upgrade to a more recent version of TOS on floppy be
obtained (e.g. latest Rainbow TOS ?) in Switzerland/Europe
* can an upgrade to a ROM-based TOS be installed in his machine

Any information would be greatly appreciated. Please e-mail me at the
address shown below.

Thanks in advance,

3135. Ethernet --- PAM's NET

Newsgroup: comp.sys.atari.st
Date: 1990-04-02 14:14:00 UTC
From: Ritzert@DMZRZU71.BITNET
Message-ID: <900402141432.284491@DMZRZU71-UNI-MAINZ--GERMANY>
Source record: 242116

we've just installed a small st network based on pam's net. It runs
smoothly, but a few programs show problems. Among them, there are gulam
and uniterm 2.0e (grrrrr.......). Here a short summary of the problems
to be expected:
gulam: ls can't list the files contained on a floppy,
only the amount of occupied space. Since the desktop
and gnome list the directory of a floppy correctly,
it must be a bug in gulam (Mediach() ?). Tested
versions: 1.00.00.02 and 1.03.04.04.
uniterm: redirection to a remote serial interface is not
possible. Accessing the local serial port works.
Looks as if Simon has programmed the
serial port directly. No other problem observed.
Does anyone still have an older version of uniterm?
1.7 or 1.8? These older versions are much less opti-
mised for speed. So there is a chance that these
older versions work better with the net.
Gulam's builtin terminal emulator can be used to acces a remote serial
port, but it does no graphics.
In addition, some programs written in Absoft Fortan using the compiler's
system interface don't work correctly.

>going on, and my version is 2.0e 010. Is that the highest there is?
>
>Have I got a rarity? Should I have it insured?? :-)

Far as I know, that is the highest existing version. I have not been able to contact Simon Poole for quite some time; I've been trying to verify this. It appears he has graduated, and I have had rumours of commercial site mail-addresses for him but have not gotten replies to my attempts to get in touch.

2.0E010 was released by accident. (Simon said he did not intend to release it, but accidentally invoked his 'distribution' script.) The only change between 2.0E009 and 2.0E010 (according to him) was that 010 fixed a small bug in one of the Tek emulation changes that was listed as having been made in 009, No, I don't know what the bug was...

10 Bombs means trap 10. This is the line A hdlr.
This would imply at least an invalid Line A command, or that
the line A hdlr didnt get loaded at boot time.

When I get Lots of bombs (>4) it usually means that memory is
usually corrupted real bad, and the power has to be turned off
for several seconds just to reboot.

From: david.megginson@canremote.uucp
Message-ID: <90040213364468@masnet.uucp>
Source record: 242149

Has anyone compiled a decent binary version of Bison and Flex for the ST? I have the distributed binaries and source. When I try to recompile Bison with my 16-bit compiler, it _always_ dies. I used to have Gnu C 1.34, but the libraries did not do proper CRLF translation.

If anyone has a version of Bison (and Flex) binaries which translate CRLF to LF on input, and LF to CRLF on output, could you please send me a uuencoded copy of the __binaries only__ (I don't need docs or support files) at my Bitnet address? I am developing a large Unix program T.A.L. (Text Analysis Language) on my ST (it will be out in a couple of months as freeware, with full source, for the ST as well as Unix), and I really need a decent Bison and Flex. Thanks in advance to anyone who can help.

Perhaps the question here is the line between Moderation and Censoring.

I had thought that Moderated Binaries served to supply:
1. flow control -- send only so much per day.
2. eliminate duplication.

Now Censoring as been added. But is it a valid function of the Moderator?

P.S.
I never distribute thru atari.binaries for just this reason. I don't
need a self appointed Censor picking through code looking for
an Offensive line.

> but then how does one extract the base name (ie get test from test.arc)?

The answer is simple: you can't. Gulam (at least the current
version) does not support any string processing.

That makes three of us! I contacted ICD about the possibility of buying their mech and software - and they said - no way, we have to buy the entire unit. I see a huge potential market for someone who does actually write software so that the ST could use any standard tape drive unit - after all, the ICD adaptor is pretty much 100% SCSI and their should be no reason why it couldn't handle a standard $250 tape drive mech with the right software.

Source record: 242007

Hi!

Has anyone out there heard of any pcb designers (or indeed circuit design tools, etc) that are available for the ST? Obviously anything that's PD/Shareware would be great. I know there was one a couple of years ago, but it was #200uk, and that's a bit much...

Of a more immediate (but related) nature, has anyone got any pcb designs for memory expansion boards (I've a very old STM, but any model will do!). Just about any type of dump will do (HPGL, PostScript, etc)...

This is a desparate attempt to avoid having to write one, of course!

Thanx in advance,

bob

Someone seems to ask about the meaning of bombs quite regularly,
and answers seem to go across thenet quit regularly. Anyway, here
is a description of what the bombs mean (summarized from the MWC
manual).

The bombs indicate a processor exception (i.e. the hardware has
discovered an error) and the number of bombs refers to the number
of the exception. That is, 10 bombs means exception number 10.
Here is a list of these exceptions:

2 bus error
3 address error
4 illegal instruction
5 zero divide
6 CHK instruction
7 TRAPV instruction
8 privilege violation
9 trace
10 line A emulator
11 line F emulator
12 - 14 reserved

I would guess (just a guess since I've never got 10 bombs) that
there is an error calling one of the line A functions.

3146. make problems with MWC

Newsgroup: comp.sys.atari.st
Date: 1990-04-02 17:15:18 UTC
From: swklassen@tiger.waterloo.edu
Message-ID: <22763@watdragon.waterloo.edu>
Source record: 242147

I have been having problems with the make utility and MWC.
Whenever I use it I get the message:

No shell.

followed by a message that make is exiting with an error
condition. My guess is that I screwed something up in
my profile the last time I made changes to it and am hence
missing something in the environment. I haven't managed
to figure out what is wrong so I am asking for help.

Does anyone have ideas as to what is wrong? Has anyone
got this message before? I am reasonably sure (but not
absolutely certain) that it is NOT a problem with my
makefile. It seems to conform to the instructions in
the MWC manual, and works perfectly on my local Unix
system.

If anyone knows what is wrong please e-mail me.
(I'm getting tired of re-typing
cc -c -A whatever-file-it-is.c
cc -A test.c -ltree -Id:\toolkit\include
everytime I make a small change.)

Thanks for any help.

>and YES please put the .snd files at terminator if possible...

I downloaded a few. For the most part they sound better with newbell than
with soundmaster. For newbell: Speeds are (I am 90% sure after various
tests) in the first byte. It is and'd with $0f or $07 so only the last
few bits matter. They are fairly equivalent to soundmaster's 5.5,7.5,11 and
22 settings. Usually 02 or 03 is best. Only one needed 05 -- some star
trek recording.

I've been shown a neat external method.

AC==> Battery-Charger ==> Battery (12V) ==> Power-Inverter ==> AC ==> Computer.

This competely isolates you from glitches/power outages on the main AC lines.

Source record: 242118

I have been purchasing games from my supplier that are in four packs in Toronto. I seem to have a problem with some of these games such a s Operation Wolf and IK+ rolling the screen, which I know from previous experience is due to the fact that my screen is 50HZ and UK screens are 60HZ (or vice versa). Anyway, my dealer keeps telling me that these games run fine for others, and that all I have to do is adjust my screen. That doesn't work, so I'm wondering, do Ataris's newer colour screens compensate for a signal of 50Hz versus 60Hz? I have one of the original 520STs and an 1985 version colour screen too. Any help would be appreciated.

> The ballyhoo was so intense in the article that the reader would
> really think that this was indeed a 'first'.
> Now I'm just a dumb 'Joe End User' but what about the blitter chips
> for the Atari ST and Commodore Amiga?
(Essentially: How do they compare the the graphics chip?)

> Larry Rymal: |East Texas Atari 68NNNers| <Z4648252@SFAUSTIN.BITNET>

I'm no expert, but I would like to see a discussion about graphics and
graphic accellerators started.
As I understand it, this announcement is mostly hoopla, but
not because the accellerator is no better than a blitter. Apple is
talking about a second processor that is dedicated to graphics. This
is nothing really new, think of terminals on mainframes, but a better
comparison is to the various IBM graphics boards that include the T.I.
graphics chip (I'm always confusing it with their DSP chip, but I
believe the parts are the 34010 and 34020). Apple needs a processor
for their big 32 bit color displays, which creep along currently.
These accellerators speed up things because the CPU no longer has to
calculate and place every pixel on the screen and/or move it from
place to place. Instead, the CPU tells the graphics coprocessor what
it wants in a more abstract fashion (a circle of this size and color
at the top left of the screen for example) which can save much bus
bandwidth.
Blitters are essentially brainless beasts that operate much
like DMA, they're only supposed to move "rectangles of bits" around in
memory, so that your windows move about on the screen (or are
repainted with graphics created by your CPU off-screen, etc., etc.).
The Intel graphics coprocessor eliminates even this idea by allowing
the screen to display discontinuous areas of memory on screen (i.e.
you'd need only 1 bit map to display two separate windows of the same
scene instead of two copies painted into different parts of the screen
memory). Atari's blitter is a very limited beast because it must
compete with (cycle steal?) the CPU and DMA processor for time to do
its business (and they all split the memory BW with the video chips,
which get the other 8MHZ of BW that 150ns RAM can give). The Amiga
blitter is only part of a set of coprocessors that *have_their_own_

bus* and can do more than a ST can, partly because of more smarts and partly because they don't overload the processor bus until the Ami goes into overscan mode (funny, the display is what really turned me off the Ami, still does, I love my Mono monitor).
What probably *is* new about the Apple chip is its speed and/or particular features, all graphics co-processors must break speed records or become like the IBM (actually VMI) PGA board, which was dropped when its dedicated 8088 was actually slower than a '386 doing grpahics and everything else. See the spring IEEE Micro article on the newish Sun graphics board for details, that board is not exactly a coprocessor, because of what its designer learned from his earlier design, the PGA board.
I welcome corrections and amplificationson the theme. A fast display is what makes a machine *seem* fast, and I wonder what the TT will do to keep it's display quick - especially in the face of some mighty fast competition.

Bob Pegram Internet: pegram@griffin.uvm.edu UUCP: go figure it out for me.

3153. Ten Zillion People Want Digitized Sounds

Newsgroup: comp.sys.atari.st
Date: 1990-04-02 19:59:35 UTC
From: dmb@wam.umd.edu
Message-ID: <1990Apr2.195935.23111@wam.umd.edu>
Source record: 242148

Gee guys, when I said "sufficient response" I didn't mean ya had to
flood my mailbox!

OK, I can upload the 30+ sounds I have to terminator. There are a
few caveats, though.

Most of the sounds were sampled at 11KHz, so they'll sound a bit
funny when played with newbell. I'd forgotten this because I've
been using my own player which lets me specify playback speed in
Hertz. (It doesn't replace the system bell; it just plays the sample
then terminates.)

Also, since I've been using my own program, I don't know exactly what
the header for Atari samples is supposed to be. (My program just uses
the data.) Things seem to work fine when I type, e.g.,

newbell 3 foo.snd

so I think newbell just expects data as well. I know these
samples won't work with the Hippo/Navarone digitizer because
it uses relative samples instead of absolute samples. (Anyone
know of a PD program to convert these things?)

Perhaps we could persuade Dan Wilga to write a version of newbell that
would allow playback speed to be specified in Hertz (or at least one
that would allow a playback speed of 11KHz at all). Is Dan on the
net? If not, could someone reach him thru CompuServe or GEnie?

In the meantime I'll upload the sounds I have to terminator. This is
a lot of data, folks, so it'll take a few days.

A few people asked if I could send them to comp.binaries.atari.st.
I'd prefer not to do this myself since there's so much data.
Perhaps someone would be so kind as to offer to post them once
they've been uploaded to terminator?

3154. Re: SIMMs for the STE

Newsgroup: comp.sys.atari.st
Date: 1990-04-02 20:09:33 UTC
From: pegram@uvm-gen.UUCP
Message-ID: <1457@uvm-gen.UUCP>
Source record: 242120

From article <2074@atari.UUCP>, by apratt@atari.UUCP (Allan Pratt):
% OK, kids, here's the scoop: I don't know anything, I only report what
% I think is true. I'm a real person behind the glass screen you see,
% and I can be wrong or misinformed.

% Don't blame the messenger: if you don't like Atari's policy, say so,
% but don't say it in such a way as to blame me. Also, it won't help
% much to say it on Usenet. Write to Sam T. if you want to be heard.

% As it happens, I *am* misinformed about the RAM situation, and I'm
% REALLY sorry I got in the middle of this.

Me too, you gave us quite a scare and did no good for your employers.
Atari U.S. now has to deny vague leftover rumors from USENETers who didn't
see your last post or have already (like me) told their friends about
your earlier messages.

% It turns out that a policy
% decision was made a while ago to the effect that SIMMs (the socketed
% kind) are to be used when building STe's. I don't know if any were
% built before that decision, and whether SIPs were used in them. As has
% been pointed out, using SIMMs makes a machine upgradable without
% solder. It does NOT make them user-upgradable, at least not in the
% USA, where opening the shield (or maybe the case) voids your warranty.

With a 90 day warranty who cares? Just wait it out, and with SIMMS,
you're *much* less likely to damage your ST than with the various
kludges that are used to add memory to older STs. SIMMs should be
very easy to plug in if you are at all handy.

% Furthermore, policy decisions are subject to revision by future policy,
% so I still maintain it's a bad idea to assume that an STe has SIMMs
% rather than SIPs.

Memory seems to be the most popular upgrade, and all of your
competitors allow it, I hope the decision is not reversed *ever*.

% Finally, a side note: using SIMMs is not all rosy. The advantages of
% (dealer-)upgradability must be balanced against the disadvantages
% inherent in socketed SIMMs. They're less reliable: the sockets break,
% the contacts get dirty, the SIMMs come loose, etc. So your upgradable
% STe is less reliable than it would have been with soldered-in SIPs,
% along with being more expensive because socket+SIMM usually costs more
% than a SIP alone (I think). Lower reliability also translates into
% higher production costs because it lowers the yield in manufacturing,
% making the cost-per-shippable-unit higher.

But higher volume from giving people what they want should make that up 8-). Seriously, I hear that if you must have upgradeable memory, SIMMs (or removeable SIPS - if there is such a beast) are by far the best way to go, much more reliable than DIP sockets and so forth. Atari (not necessarily you Allan) knows all about socket problems by now.

% Remember, what I say here is *not* "The Voice of Atari" and in fact
% what ANYBODY says is to be interpreted in the context of what that
% person knows to be true, or has "heard" is true, and how likely it is
% that the person would have heard if the policy changed. I am *not*
% likely to be up-to-date on policy in manufacturing, because it's
% FAR from my concern, and I pass things along only to be helpful,
% not to be official.

I am sorry about the whole thing, please continue to post here, we all appreciate the answers, and the compliment of you consulting us on proposed changes to the rules of TOS and GEM. I also hope that you guys can get some more good people in to help, since my guess is that delays are stemming from too much to do, for way to few people. In future, wimp out on info from areas you are not directly concerned with, or at least preface such info with statements to the effect that you really *DO NOT KNOW THIS FOR A FACT*. I know you have a disclaimer in your .sig, but redundancy really helps get your point across within the limited bandwidth of the printed screen.

% My disclaimer: Read it. Live it. Be it.
% ==
% Opinions expressed above do not necessarily -- Allan Pratt, Atari Corp.
% reflect those of Atari Corp. or anyone else. ...ames!atari!apratt

Thanks, Bob Pegram (pegram@griffin.uvm.edu <still no sig>)

P.S. Not to open old wounds, but what about 2 levels of support (like Commordore's CATS <see comp.sys.amiga.tech> or Apple's 2 level support system) and/or working with an author to get good ST - TT system info out in an approved and timely manner, without having to do it all in house. just an idea,

RBPIII

> gulam
> gcc
> GNU emacs
> Sozobon C
> TeX (any version)
> Minix
> and Uniterm.
>

All of these programs should be utterly compatible. They might not be, but the only reason would be really dumb mistakes by the authors.

I've used Gulam on STe and it's no problem, except for the "mem" command -- the authors tried to get clever and used secret addresses.

We ran the software library we had here on the STe, and the only incompatiblities we found were with programs which made illegal assuptions, like the locations of unpublished variables and the base address of the ROM. These were mostly games; the kind of program you mention had no trouble whatsoever. That's not surprising: the STe is a superset of the ST, not a subset or a rearrangement of anything.

> C program of only one procedure is kinda pointless!)
>
> Any Comments (Or am I just an idiot with a fluke problem)

Unless you have a bad download of the Sozobon package, there must be
something wrong with your code. Sozobon is quite a competent compiler.

> [I use gcc on a sun running unix most of the time. Sozobon appears to
> not have function prototyping. It would be nice if it did.]

Right. It doesn't. Good old-fashioned K&R-style C.

Be sure you aren't giving it function declarations that really are
definitions -- i.e.,

```
#include <stdio.h>
long fubar1, fubar2(); /* fubar1 is missing () */
main()
{
long l, m;
l = fubar1(); /* <<<<<-- this will make Sozobon indignant */
m = fubar2();
}
long
fubar1()
{
/* whatever */
}
long
fubar2()
{
/* whatever */
}
```

Also, you'll find that Sozobon gets disgusted with you if you're sloppy
about the distinction between ints (or longs) and pointers.

3157. Re: Flight Simulator bombs - solution

Newsgroup: comp.sys.atari.st
Date: 1990-04-02 20:34:06 UTC
From: apratt@atari.UUCP
Message-ID: <2119@atari.UUCP>
Source record: 242123

in article <900401.00441835.016202@SFA.CP6>, Z4648252@SFAUSTIN.BITNET (Z4648252) says:
> The bomb definitions can be found in most language manuals. The
> following comes from GFA Basic 2.0's manual:
>
> 2 bombs - BUS ERROR
> 3 bombs - ADDRESS ERROR
> 4 bombs - ILLEGAL INSTRUCTION
> 5 bombs - DIVISION BY ZERO
> 6 bombs - CHK EXCEPTION
> 7 bombs - TRAPV EXCEPTION
> 8 bombs - PRIVILEGE VIOLATION
> 9 bombs - TRACE EXCEPTION

The number of bombs is the 68000 exception number which happened... 10
bombs is the Line-A exception. Line-A is used as a back-door to VDI,
but unrecognized line-F opcodes are passed through to the bomb handler.

10 bombs - Line-A ($Axxx)
11 bombs - Line-F ($Fxxx) (used by AES/VDI, unrecognized ones go boom)

There aren't any others you're likely to get... All the 68000 exception
vectors are pointed at the bomb handler at boot time; the ones actually
used by the system are re-pointed at the appropriate handler later.

3160. HD Backup (a summary of responses)

Newsgroup: comp.sys.atari.st
Date: 1990-04-02 21:25:35 UTC
From: SOFPJF@VM.UOGUELPH.CA
Message-ID: <9004030709.AA10451@ucbvax.Berkeley.EDU>
Source record: 242125

Some people wrote to me in reply to my query about HD backups.

Seems that TURTLE is VERY smooth. There is a newer version (3) available
than the one I was using. The only complaints that I got were that
some people did not like to mangle their configuration to allow TURTLE
all the memory it wants (and it wants the whole 1M, it seems).

Another point is that the archive bits are turned off when the file is
written to the staging(RAM) disk, not when they are safely on floppy,
so a problem ocurring there will mean files marked as backed up that
never made it. Both of these are the direct result of the design, and
it's unlikely the author could address these easily.
One thing I WOULD like to see (gee I want a lot for Share-ware, eh?),
is some sort of multi-tasking (2 1/2-sized RAMdisks, used in rotation?)

VAULT is pretty fast, but I gather there are some problems (2 users)
on some systems that are triggered if you allow VAULT to format the
disks (read: it's more reliable if you format them yourself first)
This seems to be a bug, and I attempted to report it to the author,
but could not get through the UUCP maze.

Attempt to open a backup disk on the desktop caused a crash (strange
non TOS format). Not totally unexpected, but messy.

I went back over my old magazines and re-discovered Meg-A-Minute, by
Dave Small and others, but haven't tried it out yet.

I tried to roll-my-own: The idea is to compress one partition into an
archive on another (assuming you have the space somewhere). I tried
ZOO, but this triggers several bugs in ZOO. I then tried ARC (ver 602
with the new 'z' parameter for directory trees), and that worked,
albeit VERY slowly (but runs unattended). Then one could use one of
the above to back that (BIG) archive to floppy. Instead, I tried
SPLITIT to break up the archive into 700K chunks, which I copied to
disk. I guess the copy of 700K files to floppy is about as fast as you
can go, as there's no stepping back & forth to directory & FAT.

Result: I'm still looking. I guess I'm spoiled by PC-TOOLS's backup
on the IBM PC. It can compress files and still keep the floppy ticking
at a good rate, all at the same time.

So what NON-PD backup systems are out there?

Comments on the above would be appreciated. Thanks.

/PJ SofPJF@VM.UoGuelph.Ca

If an idea can survive a bureaucratic review and then be implemented,
... it isn't worth doing.

Hello again:

Several people responded with very helpful suggestions as to places I could obtain software and other remedies for "Atari isolation". What I need now is some way of downloading what I (presumably will be able to) find. Our VAX does not support my downloading routines (xmodem and dft, on MI-term); the staff suggest I look into KERMIT, which suggests that not everything has changed in recent years.

Does anyone have any suggestions where I could find a version of kermit that would run on my ST (512 K) and on VAX/VMS 5.2? Or suggest an alternative? I assume that with only 512K I'm out of the running for UUCP and similar stuff...

Many thanks!

[stuff deleted]

Although I don't use MWC anymore (I've gone over to GCC v1.37), I recall once having the same problem. After some experimentation I discovered that the MWC 'Make' program uses MSH.PRG to do its work. I had re-named MSH.PRG to CSH.PRG once upon a time, and 'Make' couldn't find the shell. After changing the name back to MSH.PRG, all was well. My guess is that you need to check the name of your shell (especially if you're running something other than MSH (Gulam, etc).

Hope this information helps you out.

>Now Censoring as been added. But is it a valid function of the Moderator?

So if someone sends me a copy of, say, the Spectre GCR code, I should just post it?

I think not. I also try to keep usage of the net legal, and as I said earlier, many network usage rules cause that to mean "no commercial software." If I were to strictly interpret the rules, shareware would be disallowed, too. My main objective, as I said earlier, is to keep all this stuff away from the attention of those who would raise a fuss about it, and thereby endanger the net as a whole.

If you disagree with my policies, I'm sorry; get enough people to agree with you and you can have me replaced as moderator (I assume such a change would require the same number of votes needed to create a new moderated comp.binaries.atari.st from scratch.) I happen to think I'm doing a good job, and I know that at least a few people agree.

>2- Is there an Atari ST system with a 68030 microprocessor, capable
>of running
> a real implementation of UNIX?

Although I don't closely follow news regarding the Amiga, I understand that they are close to releasing a 030 UN*X box. I do know a bit more about the Atari however.

Currently, Atari doesn't sell such a machine, but its been displaying a 030 machine that it claims will be available by the fall (this is the latest news from Atari Canada, it is noteworthy however that other subsidiaries have claimed as early as this summer; who do you believe :-?).

Regarding the flavour of Atari UN*X, and the GUI Atari will adopt, the former is a bit of a mystery to me, but the latter is to the best of my knowledge, settled.

The December 89 issue of UNIX World contained an article on UNIX GUIs, and spent some time describing InDepth, by a French company called Non Standard Logic. According to a company official, InDepth was to be bundled with the TT's UN*X - an agreement has been signed to that effect.

Which of the two machines will be out first is anyones guess, but I'm sure both will be out soon. Further, which of the two machines will be superiour is a toss-up; I'm sure both will be quality products. IMHO, however, and only IMHO, its a fair bet the Atari offering will be less pricey than the Commodore equivalent.

Sincerely,
tellabs.canada.@canremote.UUCP (Roman O)

ps. honest, I tried to be as objective as possible in my comments
pps. in any event, here's the disclaimer:

This commentary is the sender's own, and should not be confused with the many worthy comments attributable to Tellabs Canada

>Someone seems to ask about the meaning of bombs quite regularly,
>and answers seem to go across the net quit regularly.

Another great reason for having a monthly posting.
This is definately one of those lists and answers that should be included
in the monthly posting.
Many of these questions it seems get asked about once every month.
What better way to answer them then in a monthly posting. It also
would make a great resource for all atarians. Something like a
quick reference guide:
"Everything you always wanted to know about an ST that Atari didn't tell you"
(just kidding)

But seriously, this is something that has come up for quite awhile now.
Is anyone collecting responses and working on this monthly deal? I know
someone brought it up a few weeks ago but I don't know if anything is being
done.

>>the files into one big file. Is this possible (I hope)?
>
>I don't know about your file in particular, but I frequently catenate text
>files using "Gulam" on my ST.

All this will work, but it is unnecessary. As I have pointed out
several times, Dumas' UUD program can easily be hacked to decode a set
of files without concatenating and editing them. I have made a version
called WD which will handle multiple files, concatenated files with junk
between the sections, and the IBM formats as well. Send mail to the
following address if you want it.

I have passed these code changes on to the author of UUD, but he seems
to have vanished from the net.

If there is, I'd be extremely surprised, since I've been doing this for years with my ST's. When I go home at night, I shut off the monitor and leave the system on. Frequently, I don't shut down the computer for weeks at a time. I've never had any problems as a result of it.

The main point you are missing is that it is much harder on electronic equipment to turn it off and on than to just leave it on. Most equipment failures occur during powerup. Look at it this way, When was the last time you saw a light bulb just burn out on its own while the light was on? Most of the time, it blows right when you turn it on. So, it's bad to turn electronic equipment on and off too much, but it is also bad to leave your monitor on the same picture for hours and hours. A better manual solution would be to just turn the brightness and contrast knobs down all the way, but a screensaver is better (IMHO) because it never forgets to dim the screen.

For the record, my personal favorite is oatbran. mainly because I only have 1 meg and acnnot afford to waste memory on a fancy screen saver.

3171. Strange Mega Keyboard Problems

Newsgroup: comp.sys.atari.st
Date: 1990-04-03 02:19:29 UTC
From: obryan@gumby.cc.wmich.edu
Message-ID: <1990Apr3.021929.9683@gumby.cc.wmich.edu>
Source record: 242018

I replaced my 1040 with a Mega 2 system a couple months ago, and initially everything was fine. Then I started "losing" r's. At first, I chalked it up to clumsy typing on a keyboard with a different feel (you generally have to depress Mega keys a bit further, and I was very used to my old 1040 keyboard).

After a while though, it became evident that it wasn't me, it was the Mega keyboard. Sometimes I'd lose one 'r', then get the next one OK. Once in a while I'd lose several 'r's in a row, sometimes up to five of them (with a full stroke key depression). Very rarely, I'd get multiple 'r's. I should also mention that I turned up the keyclick volume to monitor feedback, and when I was dropping 'r's, there was no keyclick either (indicating a mechanical keyboard problem).

I was fairly certain that it was a dirty (oxidized) or defective key switch (sort of odd on a brand new keyboard, but?).

After I few weeks, the 'r' problem disappeared, to be replaced by a 'g' problem! This seems pretty odd, to say the least, and seems hard to attribute to the mechanism. The 'g' problem has lingered for the last couple of weeks, and I'm anticipating it to move on to new territory soon.

Has anyone else ever experienced anything similiar to this? Or does anyone have any ideas as to what the cause might be? Perhaps some pesky varmint that moves his home periodically? (I was going to post this yesterday, but decided nobody would take me seriously if I did. The problem is real, and this is not a joke.)

HOW TO USE COMP.BINARIES.ATARI.ST

by Steven Grimm

Last update: February 20, 1990

A preliminary note, for those of you who know most of the below already: the official archives on panarthea are NOT reachable via anonymous ftp from the Internet. Read on for information about accessing them by mail, or see the table at the end of this document for a list of alternate archive sites.

_1. _W_h_a_t _a_r_e _b_i_n_a_r_i_e_s?

Binaries are files that contain information other than normal text. Usually, a binary that is posted to the net will contain executable (program) files. Binaries are distinct from _s_o_u_r_c_e_s, which are the human-readable text files that are interpreted by a computer and used to produce binaries. Sources can be modified with relatively little effort, and are usually pretty easy to read. Binaries are not intended to be viewed by a human.

_1._1. _U_u_e_n_c_o_d_i_n_g

The programs which transfer network news messages (and electronic mail) are not always capable of handling a pure binary file. They are designed to handle textual messages, and the odd symbols and characters in a binary cause them to become confused, and often to mangle the binaries. To avoid this problem, a method called _u_u_e_n_c_o_d_i_n_g is used. Uuencoding translates a binary file into text characters, so that the news and mail transport programs won't mess up. The disadvantages are that uuencoded files are about 30% bigger than the raw binary files they represent, and that you have to go through one extra step to get the binaries to work on your computer.

_1._2. _A_r_c_h_i_v_e_s _o_r "_a_r_c _f_i_l_e_s"

Usually, a program will need more than one file to work properly. The extra files might be data files, help files, or maybe some instructions for the user. In order to easily package multiple files together in one binary file, a program called "arc" (short for "archiver") is used. Arc also compresses all the files as it packages them, so that the

arcfile take up less disk space (and takes less time to download!) than it would if its contents were just thrown

together.

To confuse matters even more, two new archive programs called "zoo" and "lharc" can also be used to achieve the same effect. Zoo is superior to arc in some respects, slightly inferior in others, as is lharc. Unfortunately, you can't unpack a zoo archive with arc or lharc, or vice versa (arc and lharc are similarly incompatible with each other.)

_1._3. _U_S_E_N_E_T _a_r_t_i_c_l_e_s

The USENET has groups designed especially for transmission of binary files. They are usually called something like "comp.binaries.x," where x is the type of machine that the programs will run on. For Atari ST owners, the group to watch is comp.binaries.atari.st. Most of the binaries groups (including the Atari binaries group) are _m_o_d_e_r_a_t_e_d, which means that you can't send a program directly to everyone on the network. Instead, you send it to someone in charge of the group (the _m_o_d_e_r_a_t_o_r), who makes sure that your program works and contains the proper documentation (or that the lack of documentation is announced), and that it's in the correct format to be sent out to the rest of the USENET.

One of the restrictions of the USENET is that articles can only be a certain length. If a binary is longer than that, it must be split up into several parts, each no longer than 45000 bytes or so. This introduces yet another obstacle to people who want to transform the articles into a useful form, but it can't really be helped until the USENET starts running much more advanced news transmission software. Also, some particularly long programs may be posted over the course of several days; otherwise the net would be overloaded with lots of huge messages, and people would complain.

USENET binaries are grouped into _v_o_l_u_m_e_s, each containing about 100 articles. This is to make life easier for people who are trying to keep track of which articles have been posted. When a new volume is started, the moderator will usually post introductory articles, including a list of previously published articles.

_2. _H_o_w _d_o _I _g_e_t _b_i_n_a_r_i_e_s?

There are two ways to get binaries: first, by reading the USENET newsgroup comp.binaries.atari.st; you will see new articles within a week (usually much less) of the time they were sent out by the moderator. If, for some reason, your site doesn't receive comp.binaries.atari.st, or if you want to look through previously posted articles, site panarthea.ebay.sun.com has all the binaries stored in its

archives.

The other way to get binaries is to request them from panarthea's archive server. The archive server is a program that intercepts incoming mail messages and looks for commands inside them. You can tell it to list the available binaries, give you help, or send whichever files you're interested in. The requested files will be mailed to you. One thing to be careful of is that multi-part postings aren't placed in the archives until all their parts have been sent out to the USENET at large. This is to prevent people from requesting all 99 parts of a program the first day it appears, thus overloading the net and defeating the purpose of piece-by-piece posting.

To find out more about the archive server, send a mail message containing the word "help" to archive-server@panarthea.ebay.sun.com. Talk to an administrator at your site if that mail address doesn't work. If you don't get any response from the archive server within a few days, something may be wrong; mail archive-manager@panarthea.ebay.sun.com to report the problem.

There are other archive sites, too, such as terminator.cc.umich.edu; they contain most of the comp.binaries.atari.st software as well as some additional programs that have not appeared on the newsgroup. Some sites, such as terminator, also offer something called "anonymous ftp" if you're on the Internet. Say "ftp terminator.cc.umich.edu", and if you connect, use "anonymous" for a username, and your username for a password. See the ftp documentation at your site for more information. A recent, but possibly incorrect, list of alternate archive sites appears at the end of this article. Please send me mail if you know of any that aren't mentioned here, or if my list is incorrect. Note that panarthea does not offer anonymous ftp, as it's on a network that's segregated from the Internet.

Panarthea also offers an "auto-index" service, for people who don't have access to the USENET groups. If you request autoindex service, you will receive copies of the archive-server's index files for the binaries and sources

groups whenever new files are added. Note that if your site gets comp.binaries.atari.st, requesting autoindex is pointless and a waste of net bandwidth. Send mail to autoindex-request@panarthea.ebay.sun.com if you'd like to sign up.

_3. _H_o_w _d_o _I _d_e_c_o_d_e _t_h_e _b_i_n_a_r_i_e_s?

As stated above, turning binaries from USENET articles into a more useful form can be a multi-step process. At the least, you will need the uudecode program; it is standard software on most UNIX|- systems and is available in a couple

---
|- UNIX is a trademark of Bell Laboratories.

of forms on the Atari. Versions for other operating systems do exist, and can certainly be written with little effort. Arc is available for UNIX and other operating systems, but is not standard software. In any case, you will want at least arc on your Atari.

A version of uudecode written in ST BASIC is available in panarthea's archives (see above). It is in volume 1 of the comp.sources.atari.st directory (note that that's _s_o_u_r_c_e_s and not binaries). Once you have that, you should get the files "arc," "arcdoc," and "uucode" from volume 1 of the binaries directory. They contain the arc program mentioned earlier, its documentation, and a much better, faster version of the uudecode program.

Use the BASIC program to uudecode the two encoded files; then use arc to unpack the better version of uudecode. (Arc is documented in "arcdoc.") Note that if you're reading news/receiving mail on a computer (such as a UNIX system) that already has uudecode, you can skip most of this; you will probably just want to uudecode arc there, then download it (using kermit, xmodem, or your favorite transfer protocol - consult your site's administrator and your Atari communication package's documentation for more information. Remember to use binary mode when downloading arc files!)

So far, everything has been small enough to fit in one piece, but you will almost certainly want to try something larger eventually. The Atari "uud" program (whose source code, also suitable for compilation on UNIX systems, is available in the sources archive) is capable of easily decoding multi-part uuencoded files. Near the top of each part (except the first) will be a line like

begin part c foobar.uac

Rename each file (except part 1, which can be named "part01" or just about anything else) to the name at the end of this "begin" line, in this case "foobar.uac". Then run uud on the file containing part 1; it contains instructions to cause uud to look for the other parts. If you have a text editor or a UNIX style cat program, you can just stick all the parts together in order and run uud on the resulting (big) file; it will try to go on in the first file if it can't find the next part in a separate file. Note that uud won't warn you if it's overwriting an existing file, so don't give any of the parts the same name as the file that's being extracted from them!

If you don't have uud or would prefer to decode your binaries on your larger news computer, the procedure is somewhat more complex. Plain vanilla uudecode doesn't know

about multi-part uuencoded files, so you have to fool it into thinking that everything is in one part. First, stick all the parts together (using cat on UNIX). Edit the resulting file. Now remove all the extraneous lines of text in between the parts -- this includes mail headers, any text, lines of the form "include foobar.uad," "table" lines and the lists of characters following them, and "begin" lines other than the one at the beginning of part 1. Once you have converted all the parts into a big uuencoded mass (with no blank lines!), the regular uudecode program will work.

Obviously, this is something of a hassle, and the recommended procedure is to try to install uud on your large computer. You'll usually want to minimize the amount of data you have to send to your Atari, since you'll most likely be downloading it at a relatively low speed, and the uudecoded .arc file is the smallest thing you can download.

Zoo is available from the archives. It is simple to use; refer to the documentation included in zoobin.arc (yes, you need to use arc to extract zoo!) for more information. The uudecoding process is the same for zoo and arc files. Lharc is also available.

Most archives contain documentation; refer to the instructions in a specific program for usage information and the like. If you have problems with a particular program, send mail to the submitter (listed near the top of each part.) The moderator doesn't have time to become very familiar with all the programs that are posted, so the submitter will probably be much more helpful.

_4. _L_i_s_t _o_f _a_r_c_h_i_v_e _s_i_t_e_s

Note: I have not verified these, so this list may be
wrong. Mail servers usually respond to the word "help"
alone in a mail message. Some of the sites listed below may
not contain full archives of comp.binaries.atari.st, and
some may have other files.

Since no one seems to want to step forward about your ten bombs, I guess I'll try to answer your question. The 68000 doesn't actually have an exception (what Motorola has termed as a machine language error) which would produce 9 bombs, but it has been my experience that if a program crashes severely, it can generate two exceptions (or two sets of bombs one right after another on the screen). For example two divide by zero exceptions will cause 10 bombs (5 + 5 bombs = 10) -- so any combination which makes 10 bombs could be the two true errors, unfortunately it's very difficult to tell which two exceptions it might be.

3175. RE: TeX

Newsgroup: comp.sys.atari.st
Date: 1990-04-03 04:11:00 UTC
From: CHARLOP%DAQ%NPL@UWCHEM.CHEM.WASHINGTON.EDU
Message-ID: <9004030711.AA10585@ucbvax.Berkeley.EDU>
Source record: 242046

I just got TeX and LaTeX from Current Notes. This implementation will run on a 1 Meg machine with harddrive (although you have to boot with almost nothing in the autofolder). It came on 5 doublesided disk. The cost was $4.00 perdisk and they take mastercard and visa. It also came with some nice docs to get the novice started.

I have also seen TeX on the Terminator archive for anonymous ftp. But it is about 2-3 Megs of files to port.

Hope this helps. I haven't had time to check out the CN implemenation yet. If there is interest, I may post a review to the digest.

Woah there buddy. I seem to recall that we waited a long time
before any one volunteered. This remark is totaly uncalled for.

You are right that there is a fine line between moderation and
censorship. In my books Steve has made the right decision. The net should
not be used for a blanket distribution of commercial software.

Source record: 242025

There are two possible problems. The first is that Atari ZOO "adapts" filenames by translating characters. Two important ones are '-' to '_' and '+' to 'r'. Check the files in your \bin and \lib directories. You'll find that the compiler, for example, has been renamed from gcc-cc1.ttp to gcc_cc1.ttp. Unless you have modified the gnu.g file to account for this, gcc won't be able to find its components. This leads me to the other problem, the gnu.g file. You must customize it to your system, and execute it before using gcc.

From: warningm@prism.cs.orst.edu
Message-ID: <17307@orstcs.CS.ORST.EDU>
Source record: 242049

My mono(SM124) monitor decided to flip out on me today. It will jerk the screen back and forth horizontally for several minutes, and then shift the entire screen to the left. If you drag a icon or window to the extreme left, it will come up reversed as if the left side of the screen had been folded on top of the rest of the screen. All this will start to happen after the monitor has been on for several minutes, and you have to turn it off for a minute or so to get it back to normal.

Is this some common, easy to fix problem, or do I have to get it serviced? (It's only about two months old...)

Many thanks to all for keyfix.tos (I got ten answers !). I didn't know there were so many ST users on Usenet in France...
Well, I dowloaded keyfix.tos from Panarthea (which I should have done for a long
time). Someone else sent it to me too (Merci Fethi !). I uu-decoded it, tested it and ... it doesn't work ! I tried different system setups (TOS 1.4, 1.0, 1.6)
with/without DAs, and it keeps on giving me an 'insufficent memory tos error' (#
39) (even with a debugger : maybe an error in the program header). It seems that
I'm facing a transmission error, but there's exactly the same problem with both versions !
Now i've ordered the source from panarthea (hey, I didn't forget to have a look in my lists before crying for help !), so I hope to have a fixed Gulam soon.
Thanks anyway,
Eric

%>and answers seem to go across the net quit regularly.
%
% Another great reason for having a monthly posting.
%This is definately one of those lists and answers that should be included
%in the monthly posting.
% Many of these questions it seems get asked about once every month.
%What better way to answer them then in a monthly posting. It also
%would make a great resource for all atarians. Something like a
%quick reference guide:
%"Everything you always wanted to know about an ST that Atari didn't tell you"
%(just kidding)
%
% But seriously, this is something that has come up for quite awhile now.
%Is anyone collecting responses and working on this monthly deal? I know
%someone brought it up a few weeks ago but I don't know if anything is being
%done.

Sounds like a terrific idea. Would anyone care to go thru all of the old postings and distill all the best information into a book? (I thought not...)

What exactly can we put into a monthly posting? The intro to comp.binaries is already posted every month, and describes how to get stuff from the archive sites. That seems to be the best we can really do - all the resources are there, at the archive sites, you just need to know how to get to them.

The problem with actually digesting usenet info is verifying the accuracy or usefulness of the information. This would be highly time-consuming... And I don't know of any site that actually archives all of the discussion newsgroup. A lot of good info comes down the pipe, and apparently flows to the bitbucket. This newsgroup could seriously use the equivalent of a moderator, more like an editor or librarian. Not to censor what gets posted, but to cull thru postings and select info for archiving. Anyone care to volunteer?

3185. TT rumor

Newsgroup: comp.sys.atari.st
Date: 1990-04-03 07:44:41 UTC
From: mfolivo@sactoh0.UUCP
Message-ID: <2812@sactoh0.UUCP>
Source record: 242031

What's this I have heard about the TT possibly not having the Atari name?

I heard this "rumor" and the person has not given any kind of source. I do not believe it, unless someone out there has heard the same thing.

Another is that the TT case is to be redone- and after all that Atari did to get that thing at least a Class A certification? Perhaps so to get a Class B, but the rumormonger gave no information.

I should clarify- I will not believe that the TT will be marketed under another manufacturert unless I hear it from Atari themselves.

(Sounds like someone is more than a bit gullible to pass on everything that they heard)

3186. TOS versions and country codes.

Newsgroup: comp.sys.atari.st
Date: 1990-04-03 08:51:00 UTC
From: MFAGKCHR@HMARL5.BITNET
Message-ID: <9004040702.AA08926@ucbvax.Berkeley.EDU>
Source record: 242010

Hi,

In the recent discussion about FAT problems some people stated they
did not know what TOS version they were actually running. Or what the
country code was. Below is a short GFA Basic V3.0 program that will
show you the TOS version and date, GEMDOS and AES version and
the country code. I included a list of known country codes, but
I'm not sure they are all correct. The only ones I ever saw were
3 (for UK) and 13 (for Holland).

```
----------------------Cut here---------------------------------
' GFA basic version 3 program to show TOS, GEMDOS and AES versions,
' TOS date and country code
'
' First get the system base
sysbase%=LPEEK(1266)
'
' TOS version is encoded 2 bytes higher, date 24 bytes higher
' and the configuration bits 24 bytes higher.
'
tosversion&=10*PEEK(sysbase%+2)+PEEK(sysbase%+3) !(10 for 1.0 etc.)
tosdate$=HEX$(LPEEK(sysbase%+24))
os_conf&=DPEEK(sysbase%+28) !contains pal mode and country code
'
' For the GEMDOS version we can use GEMDOS itself
'
gemdos_version=GEMDOS(48)
gemdos_main=BYTE(gemdos_version)
gemdos_release=(gemdos_version AND &HFF00)/&H100
'
' The AES version is present in the global array
'
aes_version$=HEX$(DPEEK({GB+4}),4)
'
' get the country arrays:
DIM code(14),country$(14)
FOR i=0 TO 14
READ code(i),country$(i)
NEXT i
PRINT "System information:"
PRINT
PRINT USING "Active TOS version #.#",tosversion&/10
PRINT "Generation date: ";
PRINT MID$(tosdate$,3,2);".";LEFT$(tosdate$,2);".";RIGHT$(tosdate$,4)
PRINT "GEMDOS version: ";gemdos_main;".";gemdos_release
```

```
PRINT "AES version: ";MID$(aes_version$,2,1);".";MID$(aes_version$,3,1)
country_code&=SHR(os_conf&,1)
PRINT "Country code: ";country_code&;
IF country_code&<14
PRINT " (";country$(country_code&);")"
ELSE
PRINT "Unknown country code"
ENDIF
DO
LOOP UNTIL INP?(2) OR MOUSEK !wait for user action
END
' DATA for country identification
' source: ST COMPUTER november 1989.
DATA 0,"USA"
DATA 1,"FRG"
DATA 2,"FRA"
DATA 3,"UK"
DATA 4,"SPA"
DATA 5,"ITA"
DATA 6,"SWE"
DATA 7,"SWF"
DATA 8,"SWG"
DATA 9,"TUR"
DATA 10,"FIN"
DATA 11,"NOR"

3187. Yikes!!! All my disks are empty!!!

Newsgroup: comp.sys.atari.st
Date: 1990-04-03 08:58:55 UTC
From: loki@moncam.uucp
Message-ID: <LOKI.90Apr3095855@marvin.moncam.uucp>
Source record: 242011

Is there any obvious reason why a disk drive should suddenly think all disks are empty? It happens on both drives, even tried separately and using various combinations of cables, so I imagine the problem is on the motherboard; basically, it knows when a disk is in or out, but it just can't see the data (and I *know* it's got data on it, unless a gremlin has erased *all* my disks!!!). It tries to format, but fails right at the very end (when it tries to read/write the volume label?) The format worked, but I was unable to create a folder... Can it be something simple like a loose connection, or does it have the ring of something more ominous?

Any help greatly appreciated. I will email you a Mars Bar!!!

3188. TOS 1.4 and the UK

Newsgroup: comp.sys.atari.st
Date: 1990-04-03 09:12:52 UTC
From: XUUM24@PRIME-A.CENTRAL-SERVICES.UMIST.AC.UK
Message-ID: <$TGNFDDNRBCDZ.at.UMPA>
Source record: 242015

To everyone in the UK - has anyone managed to get hold of TOS 1.4 yet ?
I've been trying to run this new desktop GEMINI - which looks pretty
good, but it crashes. I vaguely remember something about it being for
TOS 1.4 so my old mega4 with TOS 1.09 doesn't seem to be able to cope.
Also has anyone got the blitter - does it really so an improvement and
is it worth the cost - what ever that might be?
What about the HYPERCACHE by Third Coast Tech - any pros and cons - anyone
used it with OPUS, UNITERM, TeX/Latex, SHOWDVI, DVI2SLM, TOUCHUP - being
the programs I mainly use - what about with games software - hope you
can turn it off - I have enough problems without them running even faster!

Thanks for any info
Steve C.

3189. SPECTRE & DISKCOPY & SYS 6.05

3195. SuperCharger, MSDOS HW Emulator for ST

Newsgroup: comp.sys.atari.st
Date: 1990-04-03 13:48:32 UTC
From: ogorman@espoir.hasler
Message-ID: <1242@hslrswi.UUCP>
Source record: 242033

Is anybody out there using the Condor Computer SuperCharger
MSDOS emulator for Atari ST?

For info, this is a V30, 1MByte RAM box which connects to the
DMA port of the Atari (or hard disk, in a daisy chain), and allows
MSDOS to be run, using all the I/O devices of the Atari: screen
(Hercules), keyboard, MS-mouse, floppy (720K), hard disk, serial
port (COM2) and parallel port (LPT1). It comes with MSDOS 4.01.
Upgrade to BIOS planned to allow use of Atari RAM as expansion
(or extended? I never know!) memory. Free software upgrades fo
purchasers.

Cost was UK#350, purchsed recently in London. Much to my horror,
I discovered that it is for sale cheaper here in Switzerland -- groan!

However, I have had some problems -- it occasionally crashes
when I am using Enable, an integrated WP, spreadsheet, DB and
telecoms package, and also using the Norton Commander. The
IBM Hard Disk Organiser does not function either -- it complains about
the format of the date being too complex!

The problem with Enable may have something to do with the fact that
my keyboard connector on Atari Mega-ST2 was loose, but this has now
been fixed, and the crashes still happen, although far less frequently.

Condor have indicated that they will investigate the problem, if I
can make it reproducible.

I am interested to know if anyone else is using the SuperCharger:
what packages are running and any problems encountered.

I agree with both of you, there are plenty of problems and grievances
that need to be aired, BUT ..shouldn't it be done under a newsgroup such as
comp.sys.atari.st.d ? I _think_ that is what Bob is trying to say, and he ,like
me, is fed up with wading through countless articles on 'Atari Financial
Condition',etc in a newsgroup where only articles relating to the ST's
operating system, software, hardware etc should be appearing. I think that is
where Aaron is possibly missing the point.

I know what you're thinking -

"But you are doing exactly the thing you are complaining about"

vvvvvvvvvvvvvvvvvvvvvv
Yes, because there _isn't_ a comp.sys.atari.st.d, so how do we get one ??
^^^^^^^^^^^^^^^^^^^^^^
There must be someone out there who has the power to create this newsgroup,
which I feel is definitely needed. So how 'bout it?

~~~~~~~~~~~~~~~~~~~~~~

Ok. That's my beef. However, if you feel strongly enough to barbeque me over anything,
EMAIL me, don't start another flame war. Also , there is the
possibility that I have my facts wrong, ie .st.sys.d does exist in some form,
and I don't know about it. In this case, my question becomes

"Why isn't it being used, and how come I don't know about it?"

I hope this article is received in the manner in which it was written, ie
with a more interesting and better organised .sys.st in mind.

Cheers, David.

>
> -- Greg

The isn't really an answer, but... 6.0.5 doesn't work with Spectre, including version 2.65; the system just freezes. We're probably going to have to wait a relatively long time until this gets fixed (Spectre 3.0?).

For now, 6.0.3 is probably the best choice with the Spectre. 6.0.4 works great (I use it), but the system always thinks it is running on a Macintosh 512KE.

I've been using Spectre 2.65 for a bit now... and it is a vast improvement over the older software. I'll post by compaint list about 2.65 one of these days. :-)

3199. Re: 10 ugly bombs (again)

Newsgroup: comp.sys.atari.st
Date: 1990-04-03 14:13:25 UTC
From: saj@chinet.chi.il.us
Message-ID: <1990Apr3.141325.7997@chinet.chi.il.us>
Source record: 242027

Second in frequency to questions about what some number of bombs means is
questions about what some LARGE number of bombs means (for instance, 10).
The ST seems to keep putting up bombs for errors in a line as they happen.
So more than 2 or 3 bombs is as likely to mean several errors as to mean
the particular error that would give that number of bombs.

3200. Help: second drive in Megafile 30

Newsgroup: comp.sys.atari.st
Date: 1990-04-03 14:31:57 UTC
From: hbergh@oracle.nl
Message-ID: <616@nlsun1.oracle.nl>
Source record: 242032

I've tried to connect a second hard disk to my Megafile 30.
To do this, I soldered a 20 pin header on the controller to connect the
second data cable. I put a second connector on a longer flat cable for
the 34(?) pin connector. Then I tried to access the second drive.
It was selected, but I couldn't read anything from it.

My question is: do I need to modify anything else on the controller?
While checking the 20 pin header, I found that pin 17 was connected to
ground via a strange way. Should I cut this wire?

Note: it has nothing to do with the drive, because that one works fine
as drive 0, and gets selected when connected and jumpered as drive 1.

Thanks a lot,

Herbert van den Bergh hbergh@oracle.nl

3201. Monthly 'comp.sys.atari.st' posting

Newsgroup: comp.sys.atari.st
Date: 1990-04-03 14:42:00 UTC
From: davidli@simvax.labmed.umn.edu
Message-ID: <1990Apr3.144752.21878@cs.umn.edu>
Source record: 242028

After some consideration, I've decided to volunteer to put together and post a monthly informational article. It will take me about a week to put together information from past comp.sys.atari.st postings, so you can expect a test run sometime around the 17th of April.

To be included in the posting:

1) Where can I get PD/Shareware, and how?

2) What does TOS ERROR nn mean?

3) What about them bombs?

4) Is there a PD ...
C compiler
Pascal compiler
FORTH
LISP
whatever?

5) What sort of articles would interest people reading comp.sys.atari.st?

6) Where can I get copies of ST Report and ZNET?

7) Other frequently asked (and answered) questions

Anyway, I'd appreciate some e-mail messages with your own suggestions about appropriate questions [and their solutions], etc.

About the only thing I won't be including are the monthly postings by Steve Grimm -- since he does such an excellent job keeping us aware of the Panarthea server.

3203. Gulam Hooks

Newsgroup: comp.sys.atari.st
Date: 1990-04-03 16:36:07 UTC
From: djd1@csug.cs.reading.ac.uk
Message-ID: <2172@onion.reading.ac.uk>
Source record: 242029

Hi there! I need help..

I am writing a text editor, which is to be run from Gulam. One feature that the editor has is that it can do shell commands, akin to :!<cmd> in vi. I have managed to achieve this using the SHELLP variable, as described in the article by (I think) Leroy Dickey and .. I must apologise, I cannot remember his name, but it's the chap who wrote the example program to show how to use Gulam hooks in the same article. This article was released with version 1.03.04.05 of gulam.

The problem is, when I have re-entered my editor after doing a shell escape , I lose control of all the keys in the cursor-key block on the keyboard. It is as if the action of calling gulam enables it to 'capture' these keys (for use by ue, I presume) and interferes whenever they are pressed. How do I release these keys ?? I am hoping there is some kind of hack to tell gulam to let go, and let me deal with any key presses that occur.

Can anyone help? Please?

Thanks,

David.

3204. .HIG files

Newsgroup: comp.sys.atari.st
Date: 1990-04-03 17:04:59 UTC
From: boyd@fsucs.cs.fsu.edu
Message-ID: <9004031546.AA15284@fsucs.cs.fsu.edu>
Source record: 241852

I ftp'ed an arced file called fracts (or something close to that) from somewhere, and it contained what looks like data files for a non-included program. They all ended in .HIG. Does anyone know what/where this program is? Also, anyone have a copy of Fractal Magic for the ST? I would like to hear a thumbnail review before I plunk down my cash.

> on another panasonic - same thing. I think standard IBM drives
> don't work properly on the ST - perhaps some jumpers must be set
> but the techie folks at the store I bought the drive from had no idea
> how to do it.

It depends very much on which version of the 354 (or 520 STFM) you have and
which drive you want to put into the case. I modified my '85 354 with
a NEC DSDD unit, it actually gave me less trouble than my other drive,
a Teac unit in Tandy case. Things to know:

1st: STs must have all drives jumpered as DS0 (A). Most disks are
delivered jumpered to DS1 (B) as IBM uses that for all its PC drives.
Atari and IBM just switch the select lines after the 1st drive, the idea
is that properly jumpered drives can be plugged in anywhere and work
right off the bat. Yes, ST drives are pretty much IBM compatible drives.
The down side is that most of them will not allow you to continue to
use the Atari face-plate, and you will have to hack up your drive case.

2nd: On Tos versions 1.0 and 1.2, the St looks to see if the write
protect signal has been toggled before going out to check if the disk
has a different (random - but not on genuine IBM formatted floppies)
disk ID #. Only then will it reload the disk's directory into
memory. Some disks inhibit the write protect signal when disks are
removed, and then your ST never knows that you changed disks. Usually
you can just connect ("Wire OR", wire wrap worked for me) the standard
"media change" signal to the write protect signal coming out of the
drive. Sometimes though (e.g. on Sony drives) more extensive
modifications are needed.

3rd: Late model STs used below spec drives (track to track seek time
slower than originally specified), these drives are frequently Chinons
and break easily. Don't insert a disk into them if their disk access
light is on - you could wreck a head, according to one poor soul. To
compensate for these drives, Atari added a "microcontroller board"

between the standard ribbon cable drive connection and the drive itself. You won't need this board on any decent drive, and you can dispose of it once everything works.

4th: Hartmut Semken (hase) published the software and hardware mods needed to use 1.4 Meg 3.5" drives on the Net twice in the last 6 months. The mods won't prevent you using a 360K 5.25" drive with your ST, but a 1.2 Meg 5.25" won't work. They, and some PS 2 1.4 Meg drives do not auto-sense what kind of disk is inserted in them, and the ST needs that to handle the high density drives. Basically, all you do is double the input frequency to the WD 1772 floppy controller, and set the seek times to double the usual to compensate. This can be done with an executable boot sector routine, that the DC formatter can write onto your boot disks, or you could run a stand alone program after a hard disk boot up. The only other thing you need is a new high density formatting routine so you can format your new disks properly. As if you didn't know,

THIS MOD IS NOT GUARANTEED TO WORK ON YOUR ST.

You are running the 1772 beyond its design limit speed (16Mhz vs 10Mhz max), and funny problems can crop up, above and beyond the ones mentioned above. The good news is that it may well work and the problems are usually fairly easy to fix, especially if you have access to an oscilloscope for hardware debugging (1 problem is that pulses can get too short for the drive to "see" them, and then you have to stretch the pulses with a monostable <1-shot>).

Note: I HAVE NOT DONE THIS MOD YET MYSELF!
I just like the idea a lot and will do it sometime in the future.
This is all second hand info, ask Hartmut Semken about specific problems.

I could mail or repost (if *much* interest, say >= 20 requests) the info I have on DS upgrades and on HD (1.4M) upgrades, although others who have written on the net know more about this than I do - somebody here got one of those Sony drives to work. Send requests to:

Source record: 241868

From article <11493@stag.math.lsa.umich.edu>, by hyc@math.lsa.umich.edu (Howard Chu):
I wrote:

%%Conclusions? I hope that doesn't mean the end of your experiments. If
%%it worked even at 125Khz, SGS net would be speeded up considerably,
%%and 250Khz is faster than Localtalk (= Appletalk - runs at 230Khz). I

% Well, any speed other than 500khz would mean installing a new crystal,
% or sticking in a divider. Unless you had some external control over the
% divider, both solutions would mean screwing up your MIDI and keyboard
% baud rates. But if that's not an issue for you, then you can go ahead
% and try it... It just isn't gonna be a software solution.
% --
% -- Howard Chu @ University of Michigan

Oops, I misread the original posting, and thought that there was a
programmable divider in there already, not a fixed one. I guess I
didn't know or forgot that this thing does double duty - looking
after the keyboard too.

New Topic:
I'm getting tired of things bombing under NeoDesk, it usually gives
me the source of the problem, and I'd love to patch simple problems up
(i.e. only one problem in a program, usually due to assumptions that
are no longer true). Do I have to know my TOS ROMS inside and out before
I try it? My knowledge of 68000 assembler could use a brush up, but
is adequate. I have memory and disk snooping tools, and the laser debugger
which works with assembler. Any time, or frustration level, reduction hints
would be most welcome.

Last Topic:
I can't FTP from here for now, but will you (Howard) add your Uniterm
large monitor mods to Uniterm 2.0e 011 when you put it on terminator?
Or does this version already include those mods?

Bob Pegram Internet:pegram@griffin.uvm.edu

>
>BobR

I was in Canada recently, and I talked to a dealer who said he's already mailed several STE's to the US. He didn't seem to think there was anything wrong with doing this.

And on my trip to Toronto Sunday (to the 2nd Canadian Atari Fair) I saw TONS of Atari equipment: Stacy's (the boxes were labelled LST), STEs, Monitors (both Monochrome and Colour), Megafile 30's and 44's, CDARs (CD Rom player), Lynx's, and Portfolios. Did I leave anything out? I've learned NEVER to go to another one of these shows without first bringing several thousand dollars. :-)

Prices were pretty high though for the hardware. $1800 for a 1Meg Floppy version of the Stacy. $750 for the CDAR, $200 for a monochrome monitor, $500+ for a Spectre GCR (!!!), and so on. These are Canadian dollars, but the exchange rate was only 12%, so you won't save too much if you're from the US.

Another thing I noticed was that there were only a handful of developers and a great number of dealers. This is just the opposite of a US Show, where there are tons of developers and not as many vendors.

I did get to meet the fine folks at Gribnif, Double Click, Stratos Software, Atari Canada, and others. Bob Brodie was also present and I spoke with him for a few minutes.

It was very very busy too. Also, if you get a chance to go to Toronto, stop by the CN Tower and take the 'Tour of the Universe'.. Neat!

Enough rambling for now, I'm sure others will post their impressions of the show..

>about it, and thereby endanger the net as a whole.

Wow, sounds like some pretty dire consequences. At any rate, we have
no such problems at terminator. We're always happy to accept commercial
demos. Send them our way.

N.B.: We accept demos, not the released product. Someone uploaded
TOS 1.4 to terminator last month. Needless to say, there were
some at Atari who were not pleased. Luckily, they were cool
about it. Other companies might demand that we shut down the
archive. Once again, PLEASE DO NOT UPLOAD COMMERCIAL SOFTWARE
TO TERMINATOR.

BTW, a lot of changes have been going on behind the scenes at
terminator. I'll post another article to fill ya'll in, soon.

| at a good rate, all at the same time.
|
| So what NON-PD backup systems are out there?

I've had Diamond Back for a while now. I think it might be what you are looking for. It uses the archive bit correctly, you can set it to compress files, and it seems faster than Turtle, though I haven't sat down and made timed comparisons. It is also very easy to use and quick to set up. (The latter are often overlooked as factors that affect whether incremental back-ups will actually ever get done or not!)

| He was a very nice guy on the phone, said he'd just shipped a few to
| the US...

This shouldn't really surprise anyone. There has been a
free trade agreement with canada for about a year or so now.

(Although, I confess I am a little amazed that a device which
didn't pass the US FCC testing can be sold here. Don't incoming
goods have to comply with this restriction?)

I just grabbed the 2.0e 011 files. I'll let ya know in a while, I guess.
Shouldn't be too hard to make the changes. I don't think they're already
installed.

Maybe gullible, I was skeptical....
At this point, anything Atari does, will not surprise me unless they
sell alot more ST's/TT's or computers on this side of the atlantic..

Btw, with the date of this release being April 1st, I had my doubts...
probably paranoia..but it (The AON) will have an expanded pallette.

Take with a spoon of salt...I did, it was April Fool's day!!

Keywords: Not to have Atari name?

What's this I have heard about the TT possibly not having the Atari name?

I heard this "rumor" and the person has not given any kind of source. I do not believe it, unless someone out there has heard the same thing.

Another is that the TT case is to be redone- and after all that Atari did to get that thing at least a Class A certification? Perhaps so to get a Class B, but the rumormonger gave no information.

I should clarify- I will not believe that the TT will be marketed under another manufacturert unless I hear it from Atari themselves.

(Sounds like someone is more than a bit gullible to pass on everything that they heard)

>an Offensive line.

I don't want to be interpreted as flaming ANYONE. Especially not either of the people disagreeing above, who are way high up on my list of most helpful people. But censoring (in the sense of removing inappropriate material) is absolutely for sure an important function of a moderator on a moderated group. And while Steve Grimm volunteered to be moderator, that's a long way from being self appointed (I don't remember anyone objecting much at the time).

As for the policy itself: I've never had any trouble taking something that somebody was giving away free. There are useful demos (and the Branch Always demos have always been like that) and 'teaser' demos (the classic example is a data analysis program demo that only accepts the example data supplied with it). I think (personal opinion) that the test of whether a demo belongs in a usenet newsgroup is whether it's a usable program, as distributed. It's within the moderator's proper role to make that decision. If the test was whether commercial software developers might object if something tending to hurt their business got passed along partly on THEIR phone bill, it would hurt FREE software (like opus, or form, or uniterm) that was in categories with commercial entrants.

Any newsgroup specific to a given computer is inherently a bit commercial in nature. Then you get a little more commercial when you have discussions of individual programs or accessories for that computer. It gets even a little bit more commercial when people from the companies involved get into the discussions. But up to that point, I doubt that anyone has ever objected.

Absolute purity isn't an issue because it isn't plausible. Whatever it may mean, 'The Spirit of Usenet' seems to be ok with the people paying the bills. I have my idea of when a demo is 'in the spirit of usenet' (it's useful in its own right, not just promoting a product), and when a message from a commercial entity is 'in the spirit' (informative, not excessively promotional). On an unmoderated newsgroup, it's nobodys business to enforce guidelines, but it's everybodys business to encourage staying within them. On a moderated group, it's the moderator's choice how to run things.

Have I bored and offended everyone yet? Steve J.

| I was wondering if someone could answer two technical questions:
|
| 1.) 50Hz: Setting 0x448 to something other than zero does not
| put the ST in PAL mode, does it? I downloaded hertz.arc
| from terminator, but the hertz.tos is non executable,
| i.e. no 0x601a... I have seen both a boot sector program
| and a PD 50Hz program, but I can not find them now that
| I need to disassemble them.

You must flip some bit of the I/O registers to switch between 50 and 60
Hz (it is not used for the 70 Hz monochrome display).

When I bought my hard disk, I was told to get TOS in Rom, because
things wouldn't work OK (had a disk based TOS at that time). There
appeared to be something wrong with these Roms, at least for my (color)
display: flicker, a smaller (less higher) display and higher intensity.
Sometimes, especially after a (long) hard disk access, it would jump
into the correct mode (normal brightness, no flicker, normal display
height). After some time I found out the problem, i.e. the ST was
running in the wrong mode. I wrote a small program that flips between
50 and 60 Hz and can be put in the AUTO folder (it isn't even
resident). Here it is, with source code and uue-d program. Enjoy,

Leo.

Strange effect! If you start Gemini via Headstart, where does Gemini
save its GEMINI.INF file? When Gemini finds GEMINI.RSC, it should also
find its saved settings.

(By the way: I REALLY grep incoming digests for "emini". Sorry I cannot
read all the incoming mail!)

I need to ask you on the exact procedure on
replacing the two chips on Mega2 SGS 74LS373's).

I bought two chips to replace the SGS chips, but the ones that I bought did not work. The ones I got is : 74LS373N A (SVV3423 BS) They are TekTronicks (I think). When I turn on the computer, screen lite with white foreground and block background, no disk access. The computer just hang there. Is it that I am using the wrong chip? If so, which chip should I use (exactly)? If not, what do you think is wrong with it?? (all soldering is good).

3225. Does TOS 1.4 fix 1k sector reads?

Newsgroup: comp.sys.atari.st
Date: 1990-04-04 11:28:48 UTC
From: cs325ec@ux1.cso.uiuc.edu
Message-ID: <16000035@ux1.cso.uiuc.edu>
Source record: 241879

Does Rwabs work with 1K sectors in TOS 1.4? I tried to dump
sectors from a hard disk partition with 1K sectors and found
that Rwabs (TOS 1.0) only reads 512 bytes from the sector i.e.
acts as if there were 512 byte sectors. However files stored
on the partition work fine.

Thanks.

3227. POOLFIX4

Newsgroup: comp.sys.atari.st
Date: 1990-04-04 11:55:00 UTC
From: MFAGKCHR@HMARL5.BITNET
Message-ID: <9004050709.AA03798@ucbvax.Berkeley.EDU>
Source record: 241857

I had problems to get POOLFIX3 running with CBHD 3.5 (the harddisk
driver from scheibenkleister). I asked Claus Brod about it.
It turns out these problems have nothing to do with the FAT
problems I am experiencing. POOLFIX3 just does not like any
other programs that run before it and grap the TRAP#1 vector.
Claus has send me an update of POOLFIX which he called POOLFIX4
The readme file is included below. I will send the update to
anyone who can put it on an archive site, just ask.

Chris Evelo

----------------------cut here---------------------------------
POOLFIX4 (Got to patch and get again and again... c'mon, Leila, gimme
======== a break - or: Reasons To Be Cheerful, Part 4)

Yep, it's true, TOS 1.4 is buggy. Well, ATARI has done something about
it and released several fix programs to blow up your AUTO folder. A
very... ahem... remarkable representative of this kind of programs is
POOLFIX written by Allan Pratt which tries to fix a new bug in the pool
manager. Allan released three versions of this program, and then he
settled down with a long sigh of relieve thinking he did it right at
last.

Well, he wasn't quite right. Allan's POOLFIX versions needed to be
placed first in the AUTO folder because POOLFIX tries to locate
some illegal system variables by following the TRAP #1 vector into
ROM code. If any program occupies the TRAP #1 vector before POOLFIX
shows up, things are messed up: POOLFIX refuses to install itself.

This isn't a big problem for most of you out there, but it is a
problem for people using hard disk drivers and other programs that
start up before AUTO folder programs and use the TRAP #1 vector
for their own purposes. It is also a pain in the neck for everyone
to be forced to re-order their AUTO folder once again, and as time
passes by, you tend to forget which programs in the AUTO folder
need to be started in which order, and soon chaos spreads.

I was faced with the problem when I realized that POOLFIX3 didn't
want to install itself when my own hard disk driver (included in
the book SCHEIBENKLEISTER), version 3.5, was running. This is due
to the fact that I use the TRAP #1 vector in CBHD 3.5 (my HD driver)
to do some DESKTOP.INF patching that my readers urged me to implement.
The problem, however, could have been solved easily if POOLFIX would
follow the official ATARI guidelines for XBRA completely. CBHD 3.5
uses XBRA to notify other programs that it linked into the TRAP #1
vector, and so it would be no problem for POOLFIX to follow the
